Veloce+

STe system
upgrade from
T.U.S. Developments

NEW

Bring your STe
up-to-date with
Veloce+ from T.U.S.
Developments,
processor upgrade to
66020 32 Bit at 16Mhz,

additional 2 or 4Mb FastRAM and TOS 2.06
all on board. Load NYD1 into 32 Bit

FastRAM for lightning screen updates, along
with the program disk to leave 4Mb STe
Ram free for data.

Compatible with most high end STe software
packages such as CUBASE v3 and Score,
Notator Logic, Papyrus, Callamus,
Timeworks and many many more. Please call
or visit our website for further information.

Available for DIY installation (soldering
required) with full manuals or fitted by
THE UPGRADE SHOP.

- ✓ 66020 Processor running at 16Mhz
- ✓ 2, 2 or 4Mb FastRAM
- ✓ TOS 2.06 on board
- ✓ FastRAM and TOS full 32 Bit
zero wait state
- ✓ Switchable between existing 68000 and
68020 for maximum compatibility
- ✓ Compatible with IDEal
Hard Drive Interface
- ✓ Fits inside a standard STe case

Veloce+ (2Mb FastRAM)	£ 99.00
Veloce+2 (2Mb FastRAM)	£149.00
Veloce+4 (4Mb FastRAM)	£189.00

IDEal

The IDEal hard drive system from T.U.S.
Developments uses the latest 2.5" IDE hard
drives found in computers such as the
Falcon and PC Notebooks.

The entire hard drive fits inside the
standard STe case and is extremely quiet in
operation. All kits are complete with fitting
instructions, cables and software.

IDEal Interface only	£ 59.00
IDEal Interface and 170Mb Drive	£109.00
IDEal Interface and 340Mb Drive	£139.00

Other sizes available - please call

- ✓ Fully Atari compatible design
- ✓ "New" 2 drive systems - please call
- ✓ Works alongside SCSI-based systems
- ✓ Complete with formatting/partitioning
software
- ✓ Very quiet in operation

Veloce+ & IDEal Drives

Veloce+2 c/w IDEal 170	£249.00	Veloce+4 c/w IDEal 170	£289.00
Veloce+2 c/w IDEal 340	£279.00	Veloce+4 c/w IDEal 340	£319.00

Other options available

CHIEFTAH EXTERNAL HARD DRIVES

The Chiefah external hard drive from T U S. Developments brings ultra reliability and style to any Atari system

- Complete with Host Adapter and cable
- Formatting and partitioning software included
- Small case design/size
- Built in power supply and cooling fan
- Dual SCSI external connectors for daisy chaining extra devices
- 10 selection

A fully featured system that can be used on more than four computers. All systems are supplied pre-formatted and partitioned ready for immediate use

160MB	£149.00
200MB	£179.00
540MB	£232.00

HI RESOLUTION 14" MONO MONITORS

Improve your clarity with T U S 14" mono monitors for the Atari ST range. High resolution screens ideal for Calamus, Notepad and many other programs. All monitors include appropriate connecting leads and a tilt and swivel stand

Without stand	£24.00
With stand	£309.00

(prices ex VAT)

ATARI MEMORY

STe/Mega STs	
1/2 meg	£19.00
1 meg	£29.00
4 meg	£49.00

STFM Memory	
1/2 meg	£34.00
1 meg	£59.00
4 meg	£75.00

All kits are supplied with comprehensive fitting instructions, testing software and a free disk of useful PC/Shareware utilities

TOS 3.06

- Enhanced operating system from Atari
- Improved desktop
- Full keyboard control of windows
- Place programs on desktop for easy launching
- Assign functions to keyboard shortcuts
- Breakers give access to old TOS system for complete compatibility
- All kits supplied with full fitting instructions and TOS manual

STe/Vanessa 3.06	£47.00
(TOS 1.6.03.06 supplied) Simple customer installation	
STFM/TFM boxed free	£54.99

HIGH DENSITY DRIVES

- Easy exchange of data with other platforms
 - Your ST reads and writes high density (1 MBps) discs
 - Fully automatic switching controlled by type of disk placed in the drive
 - Complete with software drivers and high density formatting software
- High Density Module £29.00
High Density Module and 3MB disc drive £49.00
- Note: TOS 1.4 or above required for high density support

TOS 2.06 & HIGH DENSITY DRIVE PACKAGE

STe TOS 2.06 with HD Drive & Controller	£59.00
STFM TOS 2.06 with HD Drive & Controller	£199.00

MODEMS

Do you want to send email, browse the world-wide web and join in the online revolution with your Atari? Using one of our modems and suitable software you can do just that

T U S 23,000 Voice, Data, Fax Modem	£29.00
T U S 57,600 Voice, Data, Fax Modem	£34.00

EASY approved with CD software, complete with cables and software for Bulletin Board access

SERIAL PORT UPGRADE

Use a fast modem on the ST which is by installing a T U S 57,600 baud serial port upgrade kit

ST/STing with full instructions	£22.00
If supplied with any of above modems	£18.00

REPAIRS AND FITTING SERVICE

Fully trained staff ready for any ability repair. All jobs quoted for individuality (no fixed price). All parts guaranteed on short stock we have 4 weeks warranty as standard. Courier collection and return available for £14.00

We can fit any of the advertised products to your machine for a one off fitting charge of £15.00. This includes the technicians at upgrade and a high density drive (free) then the charge is £19.00

Please telephone for an appointment before fitting your machine or call if courier collection is required. Please ensure all parts collected are adequately packaged

Replacement internal drive kit

For any ST with internal drive. High quality mechanism with stand offered and ST's it requires 1Mb or 2Mb drive supplied £29.99

Power Supplies

Repaired and supplied (call for available)

● STe real time clock £22.99 ● Replacement Mouse £12.99

● STe/Falcon Stereo speakers with leads £19.99

Double Trouble?

Have you reached double-digit monthly two years after the US newstand magazines gave up on the Atari scene and had all? To underline we pointed out in the glass cover!

In our all good news this collection and advance, I will have just posted and as a result I the bright area. As long as we contribute as we have in their company, creating the first software coming up with features of features and require us, were prepared to put in the money (if what needed to publish the new line). Their enthusiasm is a real motivation to keep going to think to each and every contributor has getting in this for a job of it, to contribute something to publish in please send it by email or on disk to the contact points in the masthead opposite and will get in touch.

Apple's recent comeback has proven the third stronghold a not feasible. The Atari TOS based computer cannot offer another lead it gives looks to its offer. Atari produces a competitively priced alternative to a tip in PC World. Quite when the Atari has into the upgrade looking order seems to be very in the Atari has little too late as just enough just in time! As soon as we can get our hands on a home machine we'll set about answering these questions by reporting a detail exactly what these machines are capable of.

Finally just in case you're wondering, where the cover idea went, we let them off because we didn't want to spoil the stunning cover image (we'll be back next time, we're somewhere!)

Joe Connor

News...

Audio File Selector

AFS is a desktop accessory which can be used with Cubase and other applications. It is a file selector with a difference: selecting an AIF/RAW/WAV file plays it! AFS will be integrated into future SOFTJEE projects.

ALCORNCD

ALCORNCD is the first sound to MIDI translator available for the Atari platform. You can load an audio file and translate it to a MIDI sequence. The sequence can be displayed in key edit mode where it can be played or saved. However, don't expect it to convert your favourite tracks into beautiful scores! Here's a few features:

- Convert 8 or 16 bit audio files to any frequency to MIDI file
- Real-time play back of the entire audio file
- Play MIDI files Original MIDI file played
- Display MIDI file in key edit mode
- Simultaneous display of audio and MIDI file

Pretty

Pretty is a MIDI file player with MIDI GUT! Play lots of modules and module folders can be played. Pretty includes a Record Module to record the MIDI file to audio and a Grid into Module to display/change the MIDI file.

SOFTJEE software is available from:

- France: Les Termes du Millieu
- Scandinavia: Jager Rock
- Germany: Palla Verlag
- US: Systems For Students
- UK: Team Design
- Contact: SOFTJEE P 4300
- DISPOURABLE France
- Tel/Fax: +33-05 55 33 44 67

Order: softj@atari.fr
http://www.parc-td.fr/~softj/

ExtraPorts 48

Cheap! MIDI interface for the Atari ST which offers 1 MIDI OUT ports and 48 extra channels. Just plug its 25 way D-sub connector into the random port of your Atari and for C, L and B Mega-cards that's all there is to it. Scandinavia, Germany or Canada have users read first enable the EXPORTER driver which is in your HRSOS folder (then reboot). Also works

with Macintosh (3.7 and MasterTracks PRO Available for £34.99 from Simple Solutions Professional 1/30 0400 1/11 Working Commercial Center East Lane North Wetherby, Leicestershire, UK Tel: +44(0)113 584 4147 http://www.simplesolutions.com/arcade/3.7/

ExtendOS Gold

Analyse Software have recently released the latest version of their popular CD ROM drive software which provides access to CD-ROMs and audio CDs through most SCSI CD-ROM drives. ExtendOS is compatible with Atari and most TOS compatible machines and with various hardware - supports direct audio CD to disk recording. ExtendOS Gold offers the following new features:

- Support for more CD data formats including lower/lower case filenames, long filenames and the Joliet file system extension
 - Compatibility with the CD-Rewrite recordable data format
 - Supports most CD-ROM drives
 - SCSI operations (if supported by drive)
 - Enhanced performance through improvements in cache handling
 - Further compatibility improvements with Mac OS
 - And a CD "quick play" can play a track or entire disk directly from the desktop
 - Improved controls for audio CD to disk recording
 - CD recorder supports CD creation (requires CD Writer)
- ExtendOS costs £59.95 including manual with upgrades including manual priced at £59.95. Both plus USB for shipping outside Canada. To upgrade send at your ExtendOS Pro master disk as proof of ownership.

CD Writer

The brand new release can transfer multi-CDs that can be played back on a standard audio-CD player or your CD-ROM drive. The CD tracks are created from your first

subject to your file - not nearly CD share offers.

- Modern interface
- As recording as MP3G and faster options
- Is recording over an IDE00 system.
- Reliable across time after time
- Easy install on no double or recursive copy protection
- Simulate feature saving feature
- Supports ADR, ADR and MP3 file formats
- QuickCreate feature to automatically create a complete from a folder of text files and write into CD
- Drag&Drop feature for file ordering, moving, cutting and pasting file entries inside the compilation
- Printing of CD contents (track numbers, song names, times) for inclusion in the CD jewel case
- Up to 70 tracks and 74 minutes of audio can be written (the maximum on audio CD can hold)
- Support for MP3s (ps, Yamaha, and SCSI/PMC) complete CD rewriters
- Supports TOS 1.04 and above, PlayC, HMT and Genesis

To create audio CDs, you'll also need:

- SoundBlaster Gold
- Atari ST/STX with 1 MB memory and Turbo or LeMIST have adapted Atari SoundBlaster TT/STX or other TOS compatible music to save SCSI interface
- Compatible CD recorder device
- Blank CD-R (CDs recordable) discs
- Large hard disk to store your audio files

Before writing them to a CD-R disc, CD-Writer needs US\$44.95. Please send payment by cheque or money order in US\$. Cash or pounds sterling (check exchange rate with American) to AppleLink Software, 8 Cobble Court, Ottawa, Ontario, K1W 9B1, Canada. Ontario residents please add 8% PST.

Sounds and Stuff - The Atari Musician's Toolkit

Flappetop have released their 16th Atari CD ROM into compact with the specialist knowledge of Electronic Cow's Danny McAker. This CD includes:

- Electronic Cow's entire sample library nearly a thousand high quality 14 bit ADR samples covering a vast range of instruments. There's hard sounds (percussion) and synthesized including the TRUMPET synthesizer sounds from analogue and digital synths (instruments such as the Ring T1 Roland SH-01, Juno 106, DXF and Yamaha DX7), percussion loops and

- single hits (from the Linn drum TR808, 40 and 707 amongst others) orchestral instrumentation and vocal samples
- Hundreds of music files in MIDI Pro 24, SMC, Quarter and standard MIDI file formats, covering classical, jazz, pop, drum programming and other genres
- Libraries and sound editors for most modern popular MIDI synthesizers including Borg, Roland, Sound Asia, Yamaha, Brno and Cato
- Over 3000s of Polaris specific stuff including direct to disk reconvert and other audio files and genres
- Fully working version of Sound Clay Synth v3.32

The Atari Musician's Toolkit costs £15 + P&H (UK £2, Europe £3, ROW £5) (Flappetop PO Box 335, Aberdeen, Scotland, UK AB11 6U)

ACC '98 Show Update

Plans are progressing smoothly towards the Atari Computing Convention which will take place on Sunday November 14th 1998 at: Bringle Hall, Staffordshire Showground, Stafford from 10am to 5pm.

The Showground is easily accessible by car from junctions 13 and 14 on the M6 just north of Birmingham with ample free parking and they'll be a shuttle bus service running from Stafford railway and bus station.

Tickets will cost just £3 on the door with discount for Atari Computing

show stands with further reductions for children. OAP, U400 students and orange card holders.

Since ACC98 The Portfolio Club UK have confirmed they'll take a stand and there's still time to book space. You can't miss out! Speeds cost is very reasonable £112 with power including VAT for 10 foot footage.

Flappetop have confirmed their attendance and have recently announced:

Dave and Jeff Blaine are looking forward to getting up with you all again at the Atari Computing Convention November. As well as bringing along a selection of their current products (Flowers Image 22, Art Professional, Easy Sketch, Family Series 1, Power Up Plus, Toms II and the 1 hour CD-ROM) others a number of new PD packs are being compiled in one off for the event. Russian Image 2 is expected (latest reports suggest further progress has been made, but it's not quite finished yet) and there's a couple of new releases on the pipe too which may well make it a success including a brand new range of CD-ROM products.

We've also had a few enquiries from overseas exhibitors and are prepared to offer them a special deal to help offset the travelling costs and make ACC '98 into an international event.

Calling all User Groups

ACC '98 is about Atarists having fun doing Atari stuff which means we want you to take part. Bring along your systems and share all your secrets. We're making table sized stands available to you for just £10.75 plus £4 for power inclusive. If you take a stand you get in for free, have the space and can help make the event an even more interesting for everyone, so get in touch and reserve yours now! STARWARD PROMOTIONS

Starward Promotions are promoting the show on their web page and are an added benefit to our web pages which you're welcome to add to your own web pages to link into our pages to help promote the show.

Sighting!

The composer of the score to the latest Bond movie, David Arnold, uses an ST in a recent C4 documentary on ST as a record making the score in what looked like his attic. ☺

It's not a dream ... It's available - now!

- Motorola MC 68040
- 4 EDO-Ram-Slots (up to 512 MB)
- 4 PCI-Slots, connected with an Intel PCI-Bridge for full PCI-compatibility
- 3 ISA-Slots
- 512 KB Flash-Eprom for the software-upgradeable TOS-Operating-System 4.5
- MFP-Processor for ST-compatibility
- Super I/O for PC-compatible serial- and parallel-slots
- 2 x 2 on-board IDE-controllers
- 2 high-end logic-chipsets for virtual hardware-updates
- Milan-Multi-OS 1.2 for full multitasking
- PS/2-mouse-connector
- PC-keyboard-connector
- VGA-graphics-support (up to 4 MB)
- and many more professional features ...

It's hard to believe - but it's

20 x Atari ST - 8 x Falcon - 5 x Atari TT

incredible fast!

I am going to encourage yourself and your team to start just producing an interesting and useful magazine. Just start by organizing a new Area Convention after the ones that Mike Kinsler was helping going to organize future ones. I thought that was the best I understood the best show in Birmingham and was awarded to one so many people who sold like TIG machines and companies selling them. However there was a few that I think you have discovered is already after a couple of hours there seemed to be nothing else to discover so I left. Good if you had more but was charged by the and So when I read that you have started up with a general computer and consumer electronics convention this time around I now believe you have the best trade show in the world. A gas together for Area Convention and since the majority of us also use order machines something to take the trip even more worthwhile wouldn't it? (I definitely like there you can guarantee that! Hopefully I might even buy the future live shows from you.)

I would also like to congratulate you on the A/C website - it really is rather good. One final point - are there any persons in China who were so close involved?

Please please please remember that our share will not rise over especially if you live in the Ringwood area and are in need of other facilities.

Christopher Wagner, Margaret Fisher
Email: chris@wagner.com and

Thanks for the encouragement, we're also looking forward to the show and believe it will offer the best possible show event for Atlantic, too you know along with all the other World readers!

Abstract

I was pleased to see Atari Computing looking to peripherals and their place in America. It would also be interesting if someone could explain why PC Parallel port printers are made for us. I ask this for three reasons:

- The quest for knowledge of all the *Aliae quales*
- Because there the process seems to be an automatic, genuine hardware solution that "instinctive" pattern matching cannot possibly do this or that, only to find that curiously just yet, old and more importantly, are selling the idea to enable our machines to do the same.
- De-facto as magazine articles, what seems a real piece of information to me is mentioned in passing as if it is something everyone else already knows.

What's the difference between Parallel and SCMI? It is simply calling or more than that I recently acquired a SCMI XP drive with 15 pin D sub connector instead of the 14 pin Centronics style connectors you may SCMI HD and CD and I managed to locate its pinout from Philips. Could the cartridge port be used? As time passes we will have to become more ingenious and self sufficient in finding solutions to our needs.

^aSignificance at $p < 0.05$ (two-tailed, unpaired *t*-test).

Sadly, the difference between parallel and SCSI connections goes much deeper than cabling. There was a CD-ROM IDE interface under development which plugged into the cartridge port but it was driver dependent and fell by the wayside as faster cheaper drives became available.

Abstract

Many thanks for tracking down John Hols and much praise in fact for his generosity putting out Frederick as elsewhere. There are also how successful Frederick was. Interestingly that it strongly observed by the Frederick really held its own against whatever coming range as much as it meant and what he there as a man.

success or to complete in past would mean that it is in the past. But when a client has a negative attitude about the client's current behavior, you can't say about any behavior. For anyone interpreting a line graph, you can't say about any behavior. For anyone interpreting a line graph, you can't say about any behavior. For anyone interpreting a line graph, you can't say about any behavior.

It's a kind of, erm... MagiC!

Mark Wherry buys a MagiCMac, a diet coke but no fries...

If there's one thing all computer enthusiasts have in common, it's the desire for something faster, better and cheaper. The server installed, always looking to add this or that upgrade trying to connect myself this is the last upgrade I'll "need".

With Atari no longer making hardware, we're forced to look elsewhere for that next machine. The Mac has been competing but come on how far the and after comparing the price of other TOS clones compared to their performance I was looking for another alternative. MagiCMac offered an ultra fast Atari computing platform with the benefits of Mac computing effectively throwing it for free.

The MagiCMac solution

MagiCMac is supplied on a single high density disk which updates an advanced compared to Windows or Mac OS - even taking into account many tasks are delegated to the host computer.

The compact English MagiCMac release is installed with the Atari replacement desktop which is totally unnecessary because MagiC - when it runs perfectly inside the Mac OS - does it all looking a lot like the good ol' days and is no expense you'd be better off using Thing or Java.

The initial is an interesting feature beautifully presented as a windows AS desktop. The system is good and there's plenty of detail about the Macintosh side of the program. As with MagiC Atari made it the manual a given over to an explanation of MagiCDesk, whereas I take too many Atari's, switching to

Getting Started

Installation is up to and easy and there's built-in support for trouble on everyone should be able to get MagiCMac up and running without problems within a few minutes.

The first time MagiCMac is launched a series of dialog appear to configure MagiCMac to your system. In these dialog you allocate memory, drive/CDD/CD drives and whether any Monitors are allowed parallel and master ports, waitscreen resolution.

After completing this procedure, the system boots like any old Atari machine loading Atari folder programs, icons and MagiC's auto start applications. The desktop then appears, and MagiC users will find instantly at home.

MagiCMac runs in parallel with Mac OS which means you can switch between the two - effectively using two different computers at the same time. MagiC also takes the Mac OS desktop which makes it possible to copy and paste text between applications running under mode mix.

Two become one

One thing you can't fail to notice immediately is the Mac mouse only has one button compared to the Atari two button mouse. The advantage for Mac users is that you never have to remember which button to press. But for Atari users, the right mouse button can be emulated by left clicking with a tiny modifier held down. Alternatively MagiCMac does

MagiCMac really needs only a devoted touch of a keyboard?

There are some good technical data in towards the back of the manual but really no programming documentation.

support some other Apple compatible pointing devices including two button鼠標. But ask yourself how often you use the right mouse button before paring with your money. I currently wait to be purchasing one.

Mac OS - The facts

In the same way MagiC emulates the TOS/MagiC on an Atari, Mac OS/MagiC provides the following functions:

- Displaying more than 128 colours in a tone. MagiCMac by itself can display any resolution the Mac is capable of but Mac OS is required if you want to access 64 or 32 bit colour resolution.
- Printing via GDSOS.
- Screen emulation.
- Access to TrueType fonts installed on your Mac.

Apparatus Mac OS module is required to access Mac PostScript fonts. Mac OS also works fine as long as you don't request parallel GDSOS output or resolution greater than 256 colours.

Printing is precise

The single factor which prevented me opting for MagiCMac sooner was printer support. Most Atari's own printers designed for use on PCs using the parallel bus have various Macintosh use a serial interface. One solution directly supported by MagiCMac is PowerPrint.

The PowerPrint package includes a cable to connect any PC printer to the Atari serial port along with various printer driver software which supports hundreds of printers. Although this isn't a cheap solution - especially compared to the rest of new printers - it's tried and tested and works well.

Choosing a Mac presents a dilemma. Between Mac OS was designed to run on the Motorola 68000 series of processors. The same processors found in Apple

processors. Up until a couple of years ago all Apple machines were fitted with 68000 processors and MacPlus ran native code in excellent performance figures. Now all Apple machines are fitted with Power PC processors which run 68k program code under emulation. Although Mac Plus runs fine under emulation they won't run reliably since we no longer have Apple machines fitted with real 68000 processors. Recent models and Apple's latest G3 machines aren't even fitted with the latest 68k Plus which means if you're buying an Apple machine specifically to run Mac/Plus the last machines to consider are the numbered 68000 equipped Plus or the G3 based Power Plus.

For COPS, the internal QuickTime sound synthesizer could be supported. Naturally, providing a second module (such as one provided by Roland) inside the computer (rather than a separate add-in) hardware.

In my opinion, HPLC Plus should be an integral part of HaptiCPlus – in preference to the painless inclusion of Glaxo. The reasons are promising because HaptiCPlus 3.2.4 (the current German release) includes an Eluent Delay Colour (EDC) driver which doesn't require HPLC Plus.

Abstract

As you can see from the CEI through results MapC-Mer is fast - many times faster than a Fabrix on outside machines. If the software you use runs under MapC and doesn't require access to the Fabrix, GMP or the cartridge just the MapC-Mer makes a well worth investment.

With many Apple users upgrading to Power PC, much like there are plenty of iMacG equipped machines around at bargain prices but do bear in mind you're effectively changing from one standard machine to another! The iMacG/iMacG equipped portable Apple Powerbook and Duo models also make great MacG Mac replacements and offer truly portable MacG solutions on the move.

If you decide to buy a new Mac, look for models fitted with a 200MHz G4 processor or faster. Many of the recently discontinued Mac clones maximize space and screen offer at bargain basement prices but, unless you want Apple to stop support these machines directly. If your budget allows, the recently launched Apple models like my G4 (2644-6) machine are nice, great looking!

Table 1

I would like to get better support for new software so the Macintosh system could be used. If the MacCPlus program supported OpenDoc (ODoc) a Mac management utility supported by most major Mac main programs they would even be able to write their own program. Alternatively,

LONG TERM VIEW

Just-Compiler has been using HugsC/Mini since its early releases in various portable and desktop-like Mini models. Mini's low memory HugsC/Mini offers the portable Java computing which is many times faster than the real thing and makes available memory above the 140M limit of the PalmOS providing an ideal multitasking

However, finding a path and one of the common problems encountered running any Auto assembler is finding Auto folder programs to run in the desired order. It's hard enough on real Atari machines where you either have to manually move files into and out of the Auto folder to patch the running order or use software such as *Driver*, *AutoSort* or *Alsort*. None of these methods work reliably under MagicCPU so the MagicCPU programmers came up with an **AUTOEXEC.BAT** file (not to be confused with the DOS batch file) which should be located on the Auto folder. This **AUTOEXEC.BAT** file is simply a list of your Auto folder programs in AGS3 format which MagicCPU needs to determine the desired execution order - in other words under *Basic*, *PC* and *PowerPC*.

When switched from my Polaris to PageOne I was amazed the system didn't seem to noticeably slow down whatever operations I was doing. On the other Polaris the system can be slowed to a crawl because the data has to be saved to separate graphics and normal memory segments. As more graphics data is added through this, less the bandwidth available for everything else. The Polaris designers also decided not to include any fast RAM (VRAM), probably because it was less expensive at the time, but this means much slower normal memory has to be used instead.

MagiCMax floppy disk handling has never been good compared to MagiC PC on the real thing. Pretty much implying either that standard IBM compatible (720KB or 1440KB) disks are at least not recognized or in some cases can't load the system. Happily the German release 3.2 (3.2.1) (or maybe the Mac OS 8.8.1) upgrade I installed recently seems to have cured the problems and although MagiCMax still can't launch some standard floppy formats it's now a superpowered floppy disk simulator.

1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 2680, 26

MapInfo is a mature product still undergoing development with updates to keep pace with the changing face of the GIS. Now what do I do with my Pictor? Well, only that clear, stayed apart, on-screen?

"You will return to Art one day"

Shiung Lai enacts the prophecy of his erstwhile Art teacher and lives to tell the colourful tale...

Pixel had never spun on my head disk, so when I mouse-clicked that I could understand, therefore a Chinese legend (he doesn't recall) I faced two options: run away, or grab the bull by the horns. An altogether I decide I have thought twice. The last you're reading this note either then and now is testament to the end of war. With this in mind we'll be looking at it from the ground up.

Many of the ST's best colour paint programs have died like horses and took into two separate screens, triggered by a right click of the mouse. Higher screen resolutions have required this flowering field as most recently having real issues alongside the image that can be opened and closed as necessary. Pixel offers more flexibility by using a hybrid - the tool groups may be opened permanently from the drop-down menu or selected from a context-sensitive pop-up which is just a right click away.

If the tool has a little square to the bottom right (such as the pens) is highlighted in the (overlaid) tool icons or has some other settings, similar to the level control buttons in Auto Media. Each tool has its own settings dialog, though. I say dialog as a more elegant solution would be to have a single one corresponding to the currently active tool.

An impressive array of drawing tools is available combined with the control of producing complex or fanciful from the logically separated tool, path and menu

options. You can define a palette then use that as a spray brush, for instance. By default (and this applies to most operations as well) you define the shape, choose the place it. The mouse takes some getting used to but is extremely useful and may be turned off if it is not required. To stop it off, all tools work in power mode - it is available and will make you wonder how you managed in other packages without it.

Tool response time is generally good (in some cases there is a noticeable delay) and some tracking is roughly the same. The sample points can be joined or it opened.

Powerful black manipulation

Defining a black entity seems to have no apparent effect, because it is usually copied to a visible window just where all the processing takes place. The "black window" needs to be opened manually but can be set to automatic.

In many ways I like this approach - it allows studies that use images and is subsequently relaxing. I wish to spend any a bit more on workspaces. Current use of the feature can produce spectacular pseudo texture mapping.

Adding text to pictures is easy again. It is prepared especially by a rudimentary text editor. I tried to write the review with it and found the buffer space was too small. Otherwise, save for the odd dropped character because it can't keep up and quirky line wrap, it works very adequately. For best results and access to thousands of vector fonts you should use either Speedy-8000 or NeoD. Text can be rotated too.

Creative usage is further extended with image acquisition via scanner. It works a treat with Texas Instruments and together they form a top value set workstation. Scanned images are opened in normal picture windows to be manipulated in your memory and if you wish the whole works you can also use a Macintosh graphics tablet. Most of the tools are programmed to take advantage of the, reflecting the design philosophy of giving maximum freedom to freedom. As usual, go to you'll find in great your investigations. Drivers are included for a number of popular printers, and the page setup can be saved manually.

Monochrome Pixel is a formidable goal together, you'll be hard pushed to find such a wealth of features and intuitive interface elsewhere. The real barriers in colour and it's here I experienced my first disappointment: using the drawing tools specifically running in the Pixel 16 bit true colour mode, certain tools caused a crash. I also found the colour selection window interface which lead to any of stable results. The crashing has been fixed in the latest German update but the usual tool behaviour remains unchanged.

Many paint packages assume the action of a spray can is very well randomly dispersing dots of a single colour under the cursor.

The problem is the dot pack of colours was the best of which was a much the more realistic size of droplets from a spray nozzle. Goodness on a jagged screen have to be made with a dot array of colour because the more technically accurate method produces a visible stepping. While this is a useful effect in itself, 16-bit resolutions should be sufficient to allow a more 'real' spray action which is offered in 34 and 32 bit resolutions. Considering most Amigas own-tuning accelerated Patterns will be hard pushed to display 540x480/24-bit TrueColor it feels the authors should look into the ARIO expansion and DSP support would also be useful to add a much needed speed lock in some areas and tap into the real power (anywhere in the big bird).

• Bring up the thick wire grid and delete it to the trash's content.

My personal palette modes are a pleasure to use 256 colours if you have the hardware. A choice between snap or dither reduction takes care of importing pictures with more colour than the palette which brings me to the file import/export routines. It seems compressed TIFFs are not supported and the GIF support does a little. To increase the possibility of an overnight 1 and saving and reloading two images were consistently corrupted. Everything considered, whether it is suitable for your machine depends on the screen you've got connected rather than the number of colours it can display. A dither uniform, you a minimum resolution of 313x350 is needed unless Atari made a machine I don't know about the more 57 high or above.

Another one of the pros...

Since writing the first draft of this review I've had a run with ProPaint 3 and made comparisons. I'm happy to report that ProPaint 4 has obtained new heights of sophistication and power without sacrificing user friendliness. In fact my first thought was to then I wish Pappas they gave a similar feel.

• Page 18/22 will improve the English manual despite being well written it is a solid mass of text with no screenshots and slightly poor quality given the asking price the German release includes a professionally printed manual superbly presented with capture illustrations throughout.

Last orders

ProPaint 4 is the culmination of thorough design and user feedback it is a highly evolved which shows the moment you touch beneath the surface there is far more to ProPaint than we could ever come in a review. ProPaint copies extremely across a range of hardware configurations and generally speaking what it does it does very well. I look forward to the next version.

• All these lovely ProPaint colours, they're not for nothing!

• The wallpaper center well as an extension to a program in the shape and size you!

BULLET FROM A GUN OR SNAIL ON THE RUN?

Paint Pixies was tried PixArt 4 on a standard 386, how well it would perform. Day-His reports

PIXY and Geneva 4

PixArt loaded fine and it could create nice pictures. Right clicking on the open window produced the popup menu (ringing all of the various drawing options). Actually using the drawing tools was a bit... and reasonably fast, with the exception of a few tools, especially 'brushed', which did not draw immediately. In other words, if I clicked and moved the mouse, it would take a moment to red to draw. I was drawing and update the window. I don't think though it is a problem related to my OS as PixArt did the same thing on my Pixel-ArtPixing MacG.

Loading pictures was a problem. After clicking on the picture to load PixArt should have displayed an 'load options' dialog. The problem was that only the outline of the window appeared and then my whole screen locked up. I tried altering the settings of Geneva but I could not persuade it to load any pictures in any format.

HMNT and AES 4.0

As I was having problems loading pictures with HMNT and Geneva I decided to try the original AES 4 that came with my Plus TOS disk. I returned with AES 4.0 had forgotten how slow it was and tried PixArt again. This time loading pictures was not a problem. The only thing I did notice was that loading PNG images was noticeably slower, when compared to other programs I have used such as PhotoLine and Lasso. I see. Other formats such as GIF, IMG and TGA were quite fast to loading.

The main right-clicking on an open window would produce the proper load but selecting an option was slower. Clicking on an option was not enough. To select an option I had to hold down the left mouse key for about a second before it would register. Double clicking on an option to bring up further configuration sometimes didn't work at all and so I had to go through the menu to get them.

▲ The color palette 'normal level' is relatively simple to sample but is rather slow to display.

BARGAIN BASEMENT

Christmas gift guide: PixArt 4 for UK readers at least. It is/10 is offering PixArt 4 free to registered all members by way of apology for the late arrival of this release. To obtain prospective users a free copy of SpecialGEO-4.0 is included with every new purchase of PixArt 4. everyone is a winner!

▲ If PixArt 4 running on a Mac, see below to get a support.

▲ Large order? No problem. Free delivery only and.

Strings in Resource

George Crissman invites you through the pain barrier...

Recently, I was asked what is so "revolutionary" about computer programming, anyway? The answer, mean, is *new* text!

- A feeling of accomplishment and mastery when a program finally executes and does what it is supposed to do.
- That you can make the computer do things you once *thought* it *could* do, like pulling text from increasingly unusual string formats.

your program into another language without adding the extra stuff. *Alphas* who never made a "minor change" in a program, only to discover afterwards that it crashes, hardly needs said to not to even compile leaves the value of the resource file!

The Sengweye Case

Resource Manager builds a link to the file (or files, thereof) of a program to detect a click of the RIGHT mouse button.

This method was originally undocumented by Alan Stein, resulted to repeated developers then, regrettably, documented in public finally resulting in a

trap for all in the camp you start programmer hangups when I had to admit I was wrong. Thanks, *gee?*

▲ [Right Mouse Pressed] is copied from an unused display for window display

One of the most important functions of any computer program is to present information to the operator in easy-readable text. In computerized form, text is collected as so-called "strings" and the computer takes a bunch of individual characters and "strings" and puts them together into one long line. It is common for C programmers to simply put text messages into the actual code, while the language has good string handling ability. Within this

string in-code technique is easy, simple, and quick to implement. It manages to violate a key tenet of GEM

of the operator display is supposed to be in the resource file. Keeping the messages separate makes updates easy and simplifies the process of translating

▲ Display cluster caused by the freewheel technique

During the on-line review, a test program was developed which demonstrated how to detect a right mouse button click. Since it also demonstrates the "string"

text as a usual string concept, we will take a closer look at it. If you want to know more about right button detection use the program and read the listing on the Reader Disk.

The designers of GEM allowed for general purpose text by using a "free string" in the resource construction and implementation as a fairly simple way just give the string a name, input the actual string into a field, then link to the string from your program using `mem_ptrick()`. The big drawback is having to create a link for every and actual string, and the resource deorganization in the resource window. The temptation to use the same string in two places can lead to trouble later on if the meaning in one of the two local ones must be changed, then for a truly revolutionary programming!

String, Doctor No

Buttons Used For Windows

House Button

No Method Defined
`event.button10`
`event.button11`

Neither Button Pressed
Left Mouse Pressed
Right Mouse Pressed
Left AND Right Mouse Pressed

Read Start Command ☐ ☒

▲ The form will never be displayed. Input 10 and button 11 are needed to keep the error checker in the resource project files.

Just because a form is included in a resource file doesn't mean it has to ever be displayed. In fact, the form is an excellent organizing tool if properly named (names such as "button" and "code" can conveniently stand in field window headings and C resource codes) because it helps develop a self-documenting program. As it turns out, only one `mem_ptrick()` link to the form is necessary because it contains all ready-stored "array" of strings.

The drawback is that each string must be separately accessed in your program code when downloading it to the window display routine or the printer routine. One string keeps used for string copying from the font to the array may break if the font is rearranged and stored in the resource program. The loop will not work properly but it will grab the strings in the wrong order and might even try to grab objects which aren't strings. If you do use this loop technique don't alter your resource file (there are many working methods) and you'll be OK but it's definitely not the recommended way to handle strings.

Escape From Handicaps

When starting a programming project, one of the first tasks is to design the objects for the resource file. Paving all the needed messages in one form saves the development process, allows for quick extension, and makes future editing easier.

```
/* Messages for a PRO String R/
printf("Hello", "Hello, world object")
```

```
/* Messages for a TEXT String like LAYOUT R/
printf("Hello", "textual MESSAGE 3 object")
```

```
/* Messages for a FORM String like LAYOUT R/
printf("Hello", "textual MESSAGE 3 object")
printf("Hello", "string 1")
```

▲ REMARK: When selecting a TEXT object instead of a FORM one, you can use a string object instead of a TEXT one when loading the resource file.

The only downside is marginally more code programming but this actually provides a well-documented quality to your work. Although you're a coder and experienced that improvement in your coding process. □

▲ Strongly recommended

▲ It's not really as tedious method, all object parameters techniques may be objects objects

USENET NEWSGROUP

Help is always available online in the Usenet Area. Programming forum post your news reader or comp.sys.atari.programmer

Enter comp.sys.atari.programmer

However, you get your Usenet feed you'll find the help and freely given advice in the Atari programmer area. So far, good luck no matter what your specialty. With STAR, STIMM and NEWS, available free of charge, what more do you need?

ABOUT THE AUTHOR

George Christensen lives in the US and has been a professional Atari programmer since 1987.

His latest Atari project is the port for the "Improving Standard Interface" program, an improvement on a professional programmer that gets the user "free" during loops. He also contributes to COT for the Scorpions Club.

* ON READER DISK *

▲ Be sure to read a right mouse click

R. HODGKING demonstrates the right mouse programming technique. Advanced developers can use the included RSC and RSM files necessary to change the window display and printer output to desired using ResourceMaker. The C file contains the function that handles resource strings from the form into the program, and is supplied for easy reference. If you do edit the RSC file, remember to work on a backup copy.

SpeedoGDOS 5.7

Mike Kerlake looks at the latest release of this font and printer manager...

Remember GDOS – the part of the operating system tasked with handling font management and printing? Being tied to GDOS, it did provide acceptable level of output, but it was a complete nightmare to set up. The supported printers were few in number – and it only supported interrupted fonts in a limited range of point sizes. Developers based on users' feedback and thankfully it was recognised in the marketplace all twenty years ago!

After a need to salvage GDOS by releasing FontGDOS which was quickly superseded by the better and all round FPGDOS. However it wasn't until SpeedoGDOS was released by Atari Corp using Speedo technology (created from hardware) that a satisfactory method of font management and printing was finally available.

SpeedoGDOS made it possible to use high quality Bitstream Speedo format vector fonts in some standard applications and it was incorporated by several other programs.

Although Speedo fonts looked fine and are of high quality they were both expensive and hard to obtain. Because Bitstream previously guarded the details of their format no FPGDOSware fonts have ever appeared – unlike the widespread TrueType and Postscript fonts.

Things changed for the better when COMPO Software's sales took over development of the program. Released SpeedoGDOS 5 in late 1994. There was built in support for both TrueType and Postscript Type 1 fonts, some bugs were ironed out and a wide range of popular printers were supported. Before SpeedoGDOS it was released early Atariists had resorted to NYDL which from NYDL 3 supported both TrueType and Postscript fonts. It's an external module and one could be forgiven for thinking SpeedoGDOS development had ceased. However COMPO GmbH have continued to improve and enhance the program culminating in this fully integrated version of SpeedoGDOS 5.7 with detailed printed manual.

Installation

SpeedoGDOS 5.7 is supplied on five disks with a 34 page A4 user manual which is easy to go through the installation process – it really isn't a case of 'hell yes' this

INSTALL.PRG and following the prompts. All the available printer drivers are installed, but you can delete any you don't need. The manual points out all printer and system drivers from older SpeedoGDOS versions are incompatible so make sure you delete any existing SpeedoGDOS installations if you decide to upgrade. An auxiliary program called SPIDEX, which is not automatically installed, can act as a font viewer and compiler if required.

Customising your setup

Fonts are added by running OUTLINE.PRG. Any TrueType, Speedo or Postscript Type 1 font can be added directly and even GEM compressed fonts can be added if you are prepared to hand edit your ASCII80 SYS file.

One potential area for confusion is carder management. There are three different carder to maintain and although full details of what each one does can be found in the manual, it requires a number of trial and error to arrive at optimum settings. Up to a point the bigger the carder the quicker post screen display and printing will be, but you're on your own!

The DWRITE.PRG allows you to install extra printers and configure the page size, print quality and so on. Drivers are supplied for most of the popular printers including the classic 800dpi HP Laserjet

and HP DesignJet 150C colour jet drivers and there's a surprise of more drivers in the update.

In use

SpeedoGDOS aware programs should take advantage of the improved features automatically and I am pleased to report programs such as Pagepro and Keyboard produce excellent printed output.

You may need to handle various options in the OUTLINE.PRG so programs such as EasyText Pro Monitor pick up the game on first start, but overall this upgrade should work fine into any system.

Conclusions

For anyone using NYDL there's an compelling reason to switch to SpeedoGDOS. NYDL is considerably pricier and offers both no screen acceleration and a pile integration with the Magic operating system. However NYDL 4 only supports Postscript fonts via an external module (which costs more) and superior versions are required to surpass the GDOS from MagicMasterPC.

SpeedoGDOS 5.7 delivers what it offers and it's great news for existing users that it is still being supported. If you already use SpeedoGDOS (especially v1.2 or earlier) the upgrade is definitely recommended. **D**

SPEEDODOS 5.7

Publisher

COMPO Software GmbH
UK Distributor
11014 Systems, 110 High Street, Street
Kings Hill, 47W Tel: 01434 710700
Email: 110@systems.co.uk
Cost: £49 for CD upgrade from previous versions

Requires

Any Atari 1 megabyte or more of memory (recommended hard disk)

Pros

Excellent output, compatible with most programs which require GDOS. Post Script Type 1 fonts supported in standard

Cons

No integral screen acceleration and no docs for SPIDEX.PRG

Quest for the Fuji

Our favourite platform is alive and kicking out there on the Internet - you just have to learn where to look. George Cisseman offers a few strategies worth following up...

Atari Computing

Just in case you have a vested Atari Computing magazine articles usually include web addresses for more information about products and software. These Uniform Resource Locators (URLs) make good starting points because most web pages include a home page or other related web pages. With a bit of luck you'll soon have more links than you can visit!

Usenet

Usenet is a collection of news groups dedicated to specific hobbies or interests. These newsgroups, for almost any subject you care to think of, have become more important whatever. There are public forums and anyone can join in and add their own news. It's common practice for users to advertise their home pages or special interest groups in a newsgroup's "back" at the end of each posting and as the Atari related news groups, these provide another source of Atari related web pages.

Some web browsers provide access to the Usenet, instead of typing in the standard "http://" address, enter newscomp.sps.star.it. (Click it and my forward slash / characters.) Check out NEWSIE which is an excellent Atari application specially designed to read Usenet news groups.

Web Search Engines

When asked if they've heard of search engines, most people can say "Yahoo or HotVista and that's about it." There are HUNDREDS of such sites available. Instead of visiting individual search sites you can let a search engine off the leash to check them for you automatically. The advantage offered by Meta searches is you only have to enter your search string

once to get replies from up to 11 different search engines.

World On Call
Search for more
information now!

Atari, Jeeves and Debuting are just two of many meta searches available. Does you've used them, you'll probably never use an individual search engine again!

Atari WebRing

One of the most targeted methods of searching for a particular topic is the WebRing concept.

webringing texts over 70,000 top sites.

Anyone can start a WebRing on any topic and they become the Ring administrator. After vetting the quality of the ring other web page authors can be invited or may ask to join the ring. The process involves agreeing to any rules laid down by the Ring administrator then adding the necessary HTML code along with suitable navigation graphics to their own web page. Amazingly webringing do not charge to set up or use WebRings even though each site has to contribute code with the others WebRing maintains through webring.org. Surfers can select where to WebRing in random or move from site site to the next until all sites in the ring have been visited.

The Atari WebRing includes around 100 different sites but the member number is constantly changing as new sites are accepted and others leave. ☺

Here are the most common topics to explore with webring sites:

- Pioneer Truck Madness
- El Niño
- The Great Ring
- Funniest Ring
- Cat Lover's Ring
- The Sailor Moon Alliance
- Amateur Webbing
- Amateur Webbing
- Ring of Cool Atari Fanatics
- The SPASMI (Some People Are Not Sailor Moon) Web Ring
- Art Bell Web Ring

Scantastic?

Matthew Bacon thinks so...

For years I've been happily using a RAW-based hard scanner to get photos and documents into my 370 for further editing.

However, hand scanners do have to be manually oriented across the page - a real pain I never quite mastered! They're also limited in scanning depth (width of the scanning head) (typically 180mm) or resolutions up to 480dpi.

Recently the cost of flatbed scanners has fallen through the floor making hand scanners almost redundant. Flatbed scanners remove the skill factor and offer higher resolution for the same money so recently I purchased a Microtek E6 colour flatbed scanner.

Flatbed scanners are not the most dense free-space objects - they all look very similar - the Microtek up roughly the same desk space as a standard ST-Powered, just like a photocopier, the bed hinges up to reveal a clear glass plate large enough to accommodate a full A4-sized page.

In line with current trends on other devices there are no external controls on the lid apart from the power switch. All settings are software-controlled (which for the Atari platform means you need to buy a copy of ScanX published by HORA, SYSTEMS HOUJUK).

ScanX provides a comprehensive level of control and offers similar features to those found in the PC and Mac driver software supplied by its maker.

The E6 can be connected to any Atari system with a secure SCSI socket using a suitable SCSI cable. ST owners without a spare SCSI socket will externally need a SCSI host adapter such as the ICD Link or equivalent.

ScanX can run as an application or desktop accessory. Running as a desktop accessory ScanX operates directly with applications using a GEM/Icon-based Programs that currently support GEM/Icon-based (Paint, PhotoLine and GEM/4).

When ScanX is run for the first time you are required to give the ACN/SCSI ID and model of scanner when which the scan screen is then displayed (Figure 1).

Fig 1 ScanX presents any page up to A4 at 24-bit colour. It is a freeware 1-bit hardware limit.

The area to the left of the controls on the main display (Figure 1) is called the preview window. Select PRESCAN to perform a fast scan which produces a rough preview of what is on the scanner in the preview window. The next step is to define the area to be scanned by either dragging and re-sizing the crop frame within the preview window or by typing in values.

Before scanning the defined area, the colour depth (palette of colours - greyscale etc) and the resolution (75 to 600dpi) have to be selected. ScanX also provides control over the scanning intensity (brightness, contrast and exposure). The slower the scanning velocity the more detailed the scan will be.

ScanX scans a large defined area of the defined area, if the results are not satisfactory simply change the settings and perform another scan. When scanning is complete ScanX holds the image in memory. On my HPS/Palcom A4401 page colour scan at 24-bit results in a 3.8Mb file in Tagpa (TGA) format.

Except when working in colour ScanX aims to do an 17MB format which means ST owners with enough disk storage space can scan a full A4 page at 8-bit greyscale mode.

The Microtek E6 scanner used with the ScanX driver produces excellent results. If you're into graphics or DTP this combination is currently the only dedicated scanner software system.

MICROTEK E6 & SCAN X DRIVER

Site 1: horasystems.com
http://horasystems.com/

Cost

£19.95 (includes E6 & ScanX)

Specification

20 bit single pass flatbed 1800x1800 dpi (interpolated) SCSI interface

Requires

SCSI interface -440x100 (ST high) resolution minimum 4Mb memory maximum hard drive recommended

Pros

Easy to use excellent results reasonably priced runs as a desktop accessory or application

Cons

ScanX documentation needs after more detailed about user settings. Microtek no longer produce the E6 model but its successors, the E6 & E6+ are compatible with the ScanX driver.

Scan X updated!

Don Dreibelbis reports...

As the end of April Atari Pioneer from HOMER SYSTEMS HOLMES released ScanX v1.000 for use with the Macintosh. Scansaver line of SCSI color scanner and added a whole slew of new features including:

- Support for more members of the Macintosh family system—family including the new 634+ and 634+ 6400, 6300, and 7200 systems
- Support for all Apple and graphics card resolutions from 480x480 upwards which enables ScanX now works in TrueColor mode. All users needing to 24-bit colors just to use ScanX. Colors/Macintosh Modes TT and High/HiGraphics centers will appear as the
- Choice of color or grayscale process
- Image scanning supported offering a quick and easy special effect to add to your projects
- Users can now be saved to either TIFF format or Taga format
- New works under the Geneva multitasking system
- ScanX support for users of CSH-0 v1.00 and HD Driver v1.1 (or later) hard disk driver software

In Use

My tests were limited to using my 1400K Adobe PhotoShop with Windows/Video running in TrueColor mode with a Pictorial II.

After from the extra steps in the Options dialog for colour scan and increase the memory usage exchanged and speed to single hands on design.

The new colour process option makes it easier to get a handle on the document borders and precise positioning of the cropping tool before performing your final scan.

Control users will be delighted to be able to use ScanX at last but less impressed as cleaner ScanX sales even

the system to produce a touch color programs while a scanning. It is a real gem to have to get ScanX to run a graphics program or viewer to display scan results. To avoid these limitations run ScanX as a desktop accessory. Overall the new options and improvements make ScanX even more indispensable than before two thirds up!

Buying ScanX users can upgrade the copies to the version by downloading the demo version from the web page. 40

• Negative image

• 24-bit image

FUTURE FEATURES

When the new more powerful version in the pipeline called

ScanX Pro. This release will support other file formats, the ability to make line expressions and for a closer look along with precision cropping, wrapping and making functions. I've seen the work in progress version in action and it's reassuring to know ScanX is still being actively developed and looks set to go even better.

MIDIman

Mark Wherry mixes, patches and maps the way for us...

MIDIman is a universal patch editor and MIDI mapper which runs as a desktop accessory and makes it possible to communicate with external MIDI hardware in your system. Because MIDIman is totally configurable it can be used to carry out a variety of tasks including:

- Speed editing
- Remote MIDI mixing
- Resulting complete pages of MIDI set-ups

MIDIman was originally written as software released by Hollis Research and has recently been released to Trakman.

MIDIMAN FEATURES

- MIDIman is a universal patch editor and MIDI mapper
- MIDIman is a desktop accessory so it can work alongside your sequencer and other GEM programs
- All your editing requirements can be achieved using one simple set of controls
- Can be used to remote MIDI mixer/master or local MIDI setup pages
- Can be used to create your own patch editor

Used in conjunction with Trakman MIDIman can also:

- Perform patch editing while Trakman plays or records with no lengthy waits or other glitches
- Record and playback patch info
- Control temporary parameter with MIDI effectively extending the capacity of your synthesiser
- Using every MIDI parameter has a performance control.

which prompted this reviewer and the Reader Offer on page 7.

The 30 page manual is clearly written and easily presented in an A5 ring binder along with a labelled master disk.

MIDIman is a

native product which runs on any Atari machine from a 5200/STX up to a 1040. Sadly there are a few display problems when running under PlayG but these most machines don't run PlayG for music reasons so this shouldn't be a serious limitation.

The Editor

You can never have enough sounds. I'm always on the lookout for new sound sources and quickly view of the sounds provided by my MIDI equipment. You can edit individual sounds to suit specific situations using a program capable of saving 'system exclusive' data in MIDI format. MIDIman lets you do exactly that and includes lots of example profiles on the disk to get you started.

Although most of the profiles included are for older MIDI equipment this isn't a major problem because it's easy to create your own using the internal profile language described in the manual.

Simply create a control on the screen and enter the names of MIDI commands from your manual for the required operation. Each profile can consist of many pages of controls which can be used for different aspects of your MIDI device. Fortunately a manual is provided to change channels which means you don't have to create duplicate controls to cater for different parts.

Ed: If you do create some interesting profiles please do send us a copy to the

editorial address so we can include them on a future Reader Offer for everyone to enjoy.

We are family

MIDIman was designed to be used with Trakman and the two programs integrate perfectly. MIDIman can be used before Trakman writing MIDI data generated by MIDIman to be recorded by Trakman. Similarly MIDIman can be used after MIDI data has been sent from Trakman to make sound alterations without altering your using the settings.

Comments

MIDIman deserves serious consideration by anyone requiring a graphical MIDI editor. Although there is not much support for the current crop of MIDI devices there are plenty of examples provided which makes it easy enough to create your own. For anyone using Trakman 3.1.4 a near-revolutionary comparison between the price paid for it and for writing. **D**

MIDIMAN

Publisher: Hollis Research

http: (www.hollis.co.uk/jewel)

Supplier: Atari Computing

Cost: £10 MIDIman including UK

delivery (£14 Europe) (£14 ROW) CD

Trakman and MIDIman including UK

delivery (£10 US Europe) (£17 ROW)

Requires: All Atari using external MIDI equipment.

Pros: Wide range of applications value for money integrates with Trakman.

Cons: Supplied control files are for older synths.

Supplied Profiles: The following equipment profiles are supplied with MIDIman:

Emu, Proteus Concepts, HOSOM Proton
CMA 66 Series (M 65 Reg, DM608
C64 H) Lasequo (28P) Roland Q119
C60 Jern (200) M8250 U110 U110
V90 Yamaha (300) (300) (300) (300)
M801 6001 1000 1001 1002
Some generic MIDI mixing and
performance tools are also provided.

85%

Suzy B's Software Treasury #1 and #2

Al Gould reviews another pair of Atari CD-ROMs.

There was a time. Not so long ago when it was said that it wasn't worth getting a CD-ROM player for your Atari because there was too little Atari CD-ROMs available for it. This is no longer true. There are hundreds of compilations available across Europe. However, the *Suzy B's Software Treasury* is a little unusual because it originates from North America.

In 1989 Susan and Michael Burdick ordered twenty single disks of software from a major PC disk supplier in the UK and Susan, after naming them and describing the files that they couldn't use, they were left with very little of interest. This prompted them to collect PC software themselves, and nearly two years later *Suzy B's Software Treasury*. Their collection was then released as a double CD-ROM and named *Suzy B's Software Treasury*. Originally this was distributed as unformatted files. As the time is now almost to the most complete PC collection available.

This double set has now been compressed into six files and has been re-released as a single CD and renamed as *The Suzy B's Software Treasury #1*. It contains games, Pascal68000 specific software, sound files in various formats (and players for the files), dozens of editors, financial software, desktop educational programs, databases, icons, poster drivers and many more files. In fact there are so many that even compressed they wouldn't fit on a single CD-ROM. We copied each the last that even the year Suzy B had collected many more files prompted the release of *Suzy B's Software Treasury #2*.

Suzy B's Software Treasury #2 contains a similar collection of files and also includes more Atari Works sample files and templates, clipart, the entire interactive shareware collection, table software, picture manipulation tools and more.

Both CD's share a similar and sensible structure. Files are placed in folders, and every folder has a CATALOG.ASC file explaining exactly the contents of the file. There is also a master catalog folder on each CD. This adds up to megabytes of ASCII text which take ages to read but it makes it clear exactly what each CD contains and where to find it.

Packs of the software and files are now stored with the inevitable positive files which include a run on my Falcon or under MegaC but most worked perfectly on my ST/STX systems running TOS.

Some of the contents will be familiar to you (for example, the interactive collection), but there is plenty of obscure gems in there. For example, *Band Names by One Wigg* of Oxford Software. This allows your Atari computer to generate random phrases of text. It is supposed to help break in some up with a name, strange but true!

For those of you looking for more "serious" applications there are such programs as *Play MPEG v3.0* by Martin Griffiths (1985 storage). This allows MPEG player using the Falcon's DSP and 68000 chips in concert to get five frame interlaced of MPEG videos, and *FINANCIAL* which is the Financial Calculator on Windows on the Theme of The Present Value FormulaTM v1.0 by

James C. Quid (October 1986). This program enables you to calculate first payments savings which can be made by paying off loans early and so on.

There is something for everyone on these CD-ROM collections, but you'll need time and patience to try everything out. The decision to archive everything makes casual browsing impossible and forces you with the feeling you're missing something. I've certainly spent hours clicking up and down but I have barely scratched the surface. Fortunately browsing the catalogues does narrow down the files worth extracting and I'd advise you spend ages browsing through them. I did.

Value for money?

If you were to purchase the entire collection on floppy disk it would occupy thousands of disks and cost whatever. At £29 per CD these are certainly more expensive than some of the other collections but only available. But they do represent good value for money, whether you are setting up a file base for a bulletin board, or trying to build a collection of shareware (remember to register shareware if you use it regularly). ☺

Pros:
The sheer number of files to explore really test several areas of some of the contents.

Cons:
No printed catalogue of clips or images. No search.

83%

into with the 68000 processor active. Obviously applications which require the faster VDSP chip or which hit machine-specific hardware are likely to fail but generally speaking most programs work until they don't they're probably due to resource-intensive. Popular applications, including Homerun Logic, Caliber iMacros, Score, Caliber, Papyrus and so on all work just much better. Homerun Logic running in FastRAM has to be seen to be believed.

One potential drawback: TT owners will be familiar with a memory management: The Veloci+ is 1.5 (3MHz FastRAM) and Veloci+ 4 (4MHz FastRAM) options both include extra memory which is made available for use by the operating system in FastRAM (commonly referred to as TT RAM or Alternative memory).

Programs run faster when loaded into FastRAM because they can be accessed faster by the processor but there is one same thing one which only works in ST/RAM and others which can be run in FastRAM so long as they can allocate memory in ST/RAM. To manage which programs run in what memory, flags, in the header of every program can be configured. On launching a program the operating system checks the flags and allocates memory accordingly. There are various stand alone utility programs designed to edit program header flags. TUS include a suitable utility and recommend you check out each of your applications in turn to your requirements. Replacement desktop such as Thing and Jemini can also set program flags. Determining the optimum settings is daunting experimentation, unsurprisingly there's no definitive list.

⚡ QD Flags are an if only option but has slipped to the program flag.

Installation

Anyone with sufficient experience should be able to install the Veloci+ board and no special equipment is required. The

Veloci+ board is inserted over the top of the standard 68000 processor by wedging pins between the pins of the PLCC socket and also using pins between the pins and the CPU. The same technique is commonly used to install memory upgrades. Once installed the board on around 10mm above the motherboard.

The exposed ICs on the board are a 68000 32mm square and 68000 32mm square. The board also has a 68000 32mm square and 68000 32mm square. The board also has a 68000 32mm square and 68000 32mm square. The board also has a 68000 32mm square and 68000 32mm square.

A 14 page A4 manual which includes colour illustrations, details every step of the installation process. In total there are eight flying leads to be soldered to the motherboard and two track cuts.

If you don't fancy a DIY upgrade TUS offer a courier pack up-and-repair service which, including flying, comes to just £29 extra, which is a modest value for peace of mind.

Software

A supplied utility disk includes various benchmarking and utility software along with the software required to use the Veloci+. All that's required is a single Apple II disk program which configures the processor and installs the FastRAM if fitted.

Performance

Playing video clips with sound seemed a suitable processor intensive task to test the Veloci+ without loading up anything programmed by Daler Macquinn and despite the documentation stating 33% machines are unrealistic and likely to crash, video clips I could run fine.

TECHNICAL DETAILS

The Veloci+ board is essentially a 68000 processor running at 14MHz with some wait states but this is a whole story. The Veloci+ board is a replacement kernel, effectively a total computer system in its own right.

In addition to the 68000 processor the board includes 32 to 128 Kbytes along with 32 to 256 Kbytes FastRAM (optional) running into wait states (memory access) and the decoding logic which makes up the kernel of any computer system. By making optimum use of the 68000 processor via a 32 bit data bus the Veloci+ board can process data with a maximum throughput of 31 Mbytes per second compared to 4 Mbytes per second for a standard ST.

The Veloci+ board takes control of the ST's bus system and uses the ST's motherboard as a peripheral for I/O operations.

The 32 bit data bus of the Veloci+ is established via the ST's 16 bit bus by a page system, which not only enables the Veloci+ board to send and receive data to the ST's motherboard but also enables division on the 16 bit ST's motherboard to access the RAM and ROM chips on the Veloci+ board. This means the ST's filter has access to the FastRAM which is very useful for programs such as NORD. Even when running the ST in 68000 mode the TOS 2.04 and FastRAM remains available for whenever software compatibility. To ensure reliable memory and peripheral access a multiple state ready or design bus type unit which is synchronised to the ST's original 14MHz clock.

⚡ Top left: Another standard ST cannot play the video even with the sound off. Bottom right: Veloci+ installed this image runs at 18.67/19.38 FPS. The ST's sound is on in the

System Extras

Mark Wherry reports on recent developments...

FEATURE

SYSTEM EXTENSIONS

ATARI COMPUTING ISSUE 10

We last looked at **BubbleGEM** and **GLUGA** back in ACPS, since then, coupled with InterAction's English software support for both has expanded:

Rigger Buttons

BubbleGEM has established itself as one of the most popular system extras ever with most active programmers adding **BubbleGEM** support. There was a sizeable gap between the original English CD release and release 03 but since then there have been four releases. **BubbleGEM** has come a long way and the so-called 'dream team' have been busy:

appear automatically as the mouse hovers over objects - just like the Mac/PC platform equivalents. The help screen can be turned on/off and the delay and display times can all be configured using the CPU module. Other minor additions include support for the last protocol. Previously **BubbleGEM** had only proprietary routines for changing fonts but now any other program that supports the last protocol can be used to select the current font. Also **BubbleGEM** can now optionally send out **ALT**, **SHIFT** and **KEY** messages. This means it's bubble is displayed and you carry on typing, the last character won't be overwritten by

all screens and messages of making new systems including **MultiTool**, **MAES** and **Mag C** has been improved. The update drawing routines (order in ACPS for more details) have been rewritten, although the previous routines are still there to ensure compatibility. **Proton** has also been made for clients and servers using different colour tables simultaneously. Although there's only a few 'new' features in this release **GLUGA**'s status has improved for the job it was designed to do.

The last remaining hurdle is implementing update protection. This will be based on what is to be called **GEM Component Dependency Model (GCOM)** based upon the **OLDCOM** structure of **Planar** and **ArchieX** and will effectively enable programs to run without programs. Another element being worked on for future **GLUGA** releases is **GDRC (GEM Database Connectivity)** which will work with **GEMSource** to allow databases to be integrated within **GEM** applications. **GLUGA**'s future is exciting - so stay tuned!

BubbleGEM when the bubble is cancelled. There's always the simpler and effective solution like **BubbleGEM** will become burdened with unnecessary features, taking up a disproportionate share of system resources but **Proton** Thomas has taken into that trap. **BubbleGEM** will occupy less than 25Kb memory.

GLUGA

Since we last looked at **GLUGA** there have been two new releases - the current release is v1.5. Originally **GLUGA** development has been both major and minor at the same time.

Thomas has completely rewritten the **GLUGA** manager in **PureC**, which was previously developed using **Paradoxical**. This dramatically decreases the amount of memory needed. I certainly judged the 700k memory required by **GLUGA 1.3** as an excellent investment, but even with extra features, v1.5 occupies under 500k less than **BubbleGEM**. The **GLUGA** manager can now also detect if an **GLUGA** application has crashed and re-register it accordingly. There is an extra **GLUGA** test program provided which makes altering the current installer quick and easy, currently it's more tedious as to check the **GLUGA** INF file. Programmers are provided with some extra calls to help find the path

Keytab

Keytab is not a new program. It's already in release 06, but it's one we haven't covered until now. With the popularity of emulators and cross platform development you may encounter problems handling different character sets. Each character is a bit, it's usually assigned a number and the problems arise when a character is assigned different values on different character sets. **Keytab** sets out to eliminate these problems. Although it can be launched from anywhere, the best place to install **Keytab** is in the **Auto folder** after which you can forget it. A cookie is placed into the operating system which provides functions programmers can access when handling input and output operations. As you'd expect, Thomas' own **Test** makes use of these routines.

Conclusions

Thomas' excellent **Manual Core Programmer** next page is worth checking regularly to pick up the latest additions and revisions to his utilities which are so important in fully-blown applications in the extended world being of the **Mag C** operating system.

<http://www.athis.com> page 10

10

A CPU module has now been added to configure **BubbleGEM** although originally there was bubble help! There's now an option to get box like help bubbles instead of the so called speech bubbles which placed almost all more when it added the original bubbles. Personally I still prefer the original bubbles but it's always nice to have a choice.

Loads the source file into your chosen editor

Loads the source file into your chosen editor

The most significant change is in the form of the help screens (or menu). This menu set is a separate program which could be run alongside **BubbleGEM** but has now been integrated into **BubbleGEM** itself. Watch the help screen, create bubbles

accordingly. There is an extra **GLUGA** test program provided which makes altering the current installer quick and easy, currently it's more tedious as to check the **GLUGA** INF file. Programmers are provided with some extra calls to help find the path

SUMMER

To celebrate the glorious Summer of 1998, we're offering a certified of great games and productivity software for your Atari at fantastic prices!

Do whether you're stuck inside waiting for the rain to stop, or just want to stock up for the cold winter evenings ahead, you can't do much better than grab some of these bargains!

Do you like mind games like Backgammon? Or do you prefer a shoot-'em-up? Perhaps you enjoy the challenge of a game with massive levels and hundreds of rooms to explore? No matter what your favourite genre is, we've probably got something to suit!

Hong on, not everyone uses their Atari for games, we know that, so we've bought it stocks of some serious stuff to tickle with. How about Hyperpoint, the excellent point package from Atari themselves, still good years after it was first released! Are you a bit disorganised? No fear, how about ST Organizer with its combined functions to put order into your chaos!

There's much more, so read on and place your order as quick as Badland Pete draws his gun, or you'll be disappointed!

All the software comes in the original official subtitled boxed packaging along with a full manual or instruction leaflet.

Due to the maturity of this software, you'll need an STFM and a low, medium or high resolution screen to run most of it. STe owners will find most software runs OK. Future owners are probably out of luck though!

Our extra special prices even include UK postage and packing. We welcome orders from outside the UK, but please contact us before placing your order and we can advise you of the extra postage charges that apply.

SPECIAL OFFER

Take any four items individually priced at £3.00 for just £10.00 inclusive!

BADLANDS PETE

Badlands Pete Coyote is the meanest, toughest, no gun machine! Take on the role of this man who is feared by desperadoes everywhere and fight mountain men, renegade Indians, Mexican bandits and all sorts of crazy characters in the bid to rescue the governor's daughter!

- * Countless characters
- * 3D sprite graphics

£3.00 inclusive

B•A•C•K•G•A•M•M•O•N

THE CLASSIC BOARD GAME

Backgammon is the precursor of practically every modern board-and-piece game. It is probably the oldest of all games combining skill and chance.

- * Stretch your mind muscles!
 - * Runs in ST low or high resolution
- BACKGAMMON

£3.00 inclusive

CHRONICLES OF OMEGA

A magical quest where Good clashes with Evil. Is the far off land of Omega, the peaceful existence of its people is thrown into panic as the jealous forces of evil abduct the children one-by-one. Aided by the kindness of the good witch and your own magical powers battle your way to the demon castle for the final encounter. ST Low res.

CHRONICLES OF OMEGA

£3.00 inclusive

Bob Cat has a girl in every town, but there is one whole special to his heart, Charlotte Cat. Bob uses to make her his queen!

Four massive levels with hundreds of rooms. ST Low res.

- * Stunning Animation
- * Original Game Soundtrack
- * Amazing End-Game Scene

9 LIVES

£3.00 inclusive

HEAT!

The year is 2199. The Galactic Exploration Federation has been sending mining camps to newly discovered planets on the periphery for 13 years. One of these planets has been taken over by Space Claim farmers and GAP have offered a substantial bounty to anyone clearing the planet of its unwanted

visitors. You and your ship SS Star Breaker charge course and head for New Chicago.
* STa compatible. * ST Low res
STAR BREAKER

£3.00 inclusive

Archery, 9 Lives
DISCOVERY XTRA PACK

Bumper box set of games and software. Includes 1st Word word processor, Air ST companion program, Macintosh art package. 500 City game, Escape from Planet of the Rabbit and more! * STa compatible

£6.00 inclusive

* STa compatible * Colour or mono resolutions
INTRO TO PERSONAL FINANCE £3.00 inclusive

Keep track of bank accounts, credit card transactions and mortgages with this comprehensive personal finance database and organiser. The package also includes Dextafax, a complete personal organiser that also prints out pages suitable for your carry around Address '91

MasterPlan Financial Spreadsheet

Superb financial spreadsheet package. Over 8192 x 256 spreadsheet grid. Data, Financial, Logical, Mathematical, Special and Statistical Functions. Loads of other features, including comprehensive graph displays. Hard driver, dot matrix printers and colour or monochrome monitor supported.
* 150 page manual included
* Reads/Writes WKS data files
MASTERPLAN

£8.00 inclusive

HYPERPAINT 2

Atari's classic graphics package offering a versatile, all-purpose tool for creating, editing and printing all kinds of pictures and diagrams. Work with A4 size high resolution monochrome images or with colourful, eye catching pictures in ST Low res.
* STa compatible/enhanced
* 800K included

£3.00 inclusive

Good Vibrations

Shiurring Lai discusses some advanced STe sound programming techniques...

Software exploitation of the STeTT's enhanced sound system has been doing the rounds for years, you have a set of reserved registers for playback and simple global attributes (note, volume and balance). Correspondingly, numerous STe-enhanced programs exist (mainly games, on the PC and elsewhere even) which only use basic improvements on some samples played using no more than their standard controls, perhaps in stereo.

However, there is a lot of scope beyond using hardware features as the only means to obtain values as to do what the rules say it can. Still, but hardly exciting!

To appreciate the current hardware, let's take a look at how things were done before. The Yamaha YM141/F PSG (Programmable Sound Generator) fitted to the original ST and all derivatives for compatibility, can be made to play sampled sound.

Playing samples means a performance for increasing note rate, higher frequencies necessary for good quality. This is achieved playing a sample through the Programmable Sound Generator (PSG) requires the most precision to provide feed a wide range amounts of data, far more than could ever be used by 'normally' synthesized sound (see Section 6).

Additionally the PSG also has to use a Digital to Analogue Converter (DAC) between the PSG channel and a dedicated output for this job.

After a couple of months and with the revamped STe added a new sound system driven by DMA (Direct Memory Access). DMA relies on a special processor to handle the channels and time consuming task of moving large memory blocks between sub systems with the computer, relieving the main processor to get on with something more useful like processing.

In short it was a new sound system capable of playing sample sounds without burdening the main processor. Instead about the same time transfer phenomenon was all the rage. Nevertheless,

Let's take another step into history this time, looking at the ST's original 4-bit

Analog Converter's machine had a custom sound chip with four independent voices, which could be either synthesized or used increasingly for our purposes here, sampled.

The architecture of this chip featured four DACs, each with a variable sample period. It was a long before some bright sparks realized the sample period (resonance) were small enough to make a fair approximation of a natural scale simply by playing a sample faster or slower.

Thus, the idea was born to make regular four independent, using samples of real instruments. Although not the best method, the fidelity offered by 4-bit resolution and the available processor power of the day did a darned anything more advanced.

The STeTT models have four audio DACs, also with a variable sample period, but only enough gain a rather low 100mV (0.1V) and 250kHz (0.25MHz) and 500kHz (0.5MHz) playback frequencies. We need to use software to generate more values and overcome the

small sample frequency rate, both of which are required to play a considerable note more convincingly known as 'aliasing' or 'beats'.

Pitch shifting

Proton and electronic musical instruments necessarily use samples for sounds. In common, they don't achieve this by modifying the DAC conversion rate, instead the DAC runs at a constant and the sample is stretched or squeezed with respect to time before reaching it.

Lowest sample periods produce lower notes while squeezed notes produce higher notes. This offers the advantage that the basic quality of the sound can then be enhanced.

In the first case, interpolation can be used to smooth out any coarse quantization steps related to the magnified sampling interval caused by stretching, the equivalent of 'jaggies' resulting from enlargement of bitmap images.

A simplified illustration of linear interpolation is shown in figure 1, where the mean average of the preceding and succeeding amplitude levels is used as 'fill the gap'.

Further improvement can be obtained with high order polynomial interpolation which accounts for a range of preceding and succeeding notes. This technique of artificially increasing the information density is called 'oversampling', and is standard on most digital audio sources.

Figure 1: Pitch processing of a stretched digital sound

This is how it has to be done on an STe and also why it's able to perform this pitch shifting is the main processor. Unfortunately a big chunk of its power can be drained while engaged in this activity. Consequently, real time interpolation is practically impossible on a 100% STe except at the lowest frequencies and is usually implemented. The Falcon's DMA channel also has a limited number of notes remain static, although they are of much higher bit for resolution complemented by a fast Digital Signal Processor, which is typically used for both of these jobs.

Break mixing

This second stage in playing a stretched module on an STe is getting more than one

FILES

Denesh Bhabuta goes shopping...

Wake up this morning and decided to visit our window shop. Got into a CAB and headed straight for the AGH designer software store at 100 members tel.com-800-876-917.

Even as though someone had been waiting. The month of June will no less brought upgrades to their old or prepack pieces of software we have come to love.

Of importance to most of the Atari Computing readership are the releases of CAB 3.1.7, Tracker v1.1, Teard v3.1, jones v1.1, MegaC v6 and HD Converter v1.0. Although these are currently only available in German (English versions should follow in System Solutions). However, if you understand German and can get by without English manuals, you can order them from AGH. Demo versions are available for download from the AGH web site.

Taking of German software, I visited over to Teard Das page at <http://www.teard.computerpage.com/homepage.w/TEARD/EN/> where they're currently selling HD Converter v1.0 for half the price of the English version.

Taking a random turn at the AtariWebsite I ended up on Customer Software where customer representatives are where Phoenix Bureau has been producing useful software for some time now. All the software is programmed in H-GO! BASIC and is of a high standard. Previous Phoenix releases have featured in Atari Computing Reader CD six and include Personal Organizer, Address Book and Password Protector.

Phoenix has now poured its efforts into a major project called Web Wizard, which is scheduled for release this October.

Web Wizard is intended to become a fully fledged Web authoring system, boasting a GEM interface, keyboard shortcuts, BubbleGEM and ST Guide help and a WYSIWYG display.

The Customer web site was designed using the current released version so you can get an idea of its capabilities. Web Wizard will be released as a commercial program costing somewhere between £10 to £20 and looks set to compete head on with HomePage Penguin Pro.

Indeed, Erik, the Web Wizard's son, when he'd grown up he's going to read PayPal's <http://www.paypal.com/~webhid/> where Erik had his first very long-suffering but small HTML class, which now is made HTML/STING and supports BubbleGEM, OLGA, Air Serve, DropADrop and PHP/Basic 64.

Recently there have been around four upgrades per month as they probably are a more recent release available by the time you're reading this. Currently at v3.0.0 here's the latest version features:

- Memory overhead reduced
- Web design now easier currently
- Improved mail handling
- HTML coded attachments

PayPal can create making less and the look is rather nicely finished up the package. If you'd like to be automatically informed of updates there's a PayPal web mailing list, which you can subscribe to at <http://www.paypal.com/~webhid/subscribe.html>.

Then I woke up and found myself sitting in a hairdresser's salon, just as the last call for my flight to Berlin was announced so I'm off on holiday - see you all later.

Denesh Bhabuta

Basic BASIC!

This month Paul Jones unveils his latest project - Virtual BASIC!

1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 2680, 26

In the last few years, we've been creating
 iPro, a CRM application in Haskell. iPro
 is great at managing, or better yet, the
 confidence in, a team's work. Fully
 working program, then Virtual BASIC.
 or is it the solution.

Integrated all you had to do was create your blog/website entries in a Resource file and instead of going through all the hoops we've gone through recently you could simply double click on the button you need to assign code to and type that's what I call "BASIC" web site!

Virtual BASIC (VVB) from Javel is a portable Web GameBoard. Language (VGL) patch is required. Instead of telling the computer what to do and how to do it (as in C GameBoard Language), with the VGL you simply tell it what to do. VVB is not only a portable VGL, because you will have to tell it what to do, but doesn't need a lot of overheads in deal with complex issues such as OGLA compatibility. ST GameBoard and/or can be replaced.

Figure 6

© 2004 Blackwell Publishing Ltd, *Journal of Internal Medicine* 255: 111–118

Our RAC file is loaded up with a copy of its INFO file which contains each name of every existing business/object etc. These names are displayed in the edit dialog box with the object type in brackets, just like our menu is highlighted. We click on them and the menu is displayed in the menu bar area.

The syntax can be learning like any other: click on the one we wish to assign code to. About Nothing, and Void automatically assigns a name for the object and runs the whole program to show the code.

```
SUB newClick_ABOUT
    infoDi.show
END SUB
```

As you can see there's nothing complex about the code. This happens just because our abstraction (the SUB and M42-SUB parts) are not changed. Code goes in between these two sections. The whole story:

among the program returns back your original position. Finding the left's dialog box and clicking on "Info/Dialog" then clicking Show displays the information dialog

form. Anybody could use a button could use the computer simply decides that we it will the editor runs really to ensure plan's rule. Currently, Visual only displays the object names in an object form. It is also possible to merge code in the "form_load" i.e. when the form is displayed into could contain code to remove all text from text boxes and so on).

After you've saved the source file, editors a compiler option. This takes a snapshot of the HLA/C C++ structure

ARCHIVE

Paul Jones has left the Zetland HP and consequently the H&AOC making for a void.

Find out more for yourself on our website www.bbc.com/1/health

to do, add your code and watch it work—divided into six lessons. Our big program is guaranteed and this, too, checks out code run, usually for some business machine, code using some BASIC® system.

New templates can be obtained and updated regularly. Templates can be set into by 3rd party members or HUB&C, so can even be upgraded by yourselves to reinforce the digital awareness.

If you have any ideas or suggestions for developing Virtual BOLD, do get in touch: your ideas may well be incorporated into future releases. ☺

EWING, B. T. 1993.

EMBARCATED (Embarcated Systems Application Toolset), a set of enhancements to Microsoft Graphical Toolset (MGTB) written by Paul Jones and Matthew Bacon (Canberra Software), The Hobbit Graphical Toolset, is a series of routines which can be included into your own programs to speed up development, i.e. programming. For example the MGTB offers subprograms to deal with the GEM menu, multi command. EMBARCATED is designed to do what the MGTB did but better with more menu features. Hopefully the final release version will include routines to ease GEM's linking. ST's editors help encoding routines, and many more. Besides Templates will be updated regularly and the intention is for a special version of EMBARCATED to be used as a complete offering because such as MPLE chosen by *BYRON* for his playing and so on. Templates could also be written for third parties to add their features to your library.

Suggestive Remarks

Mike Katslake with a progress report on recent suggestions and some ideas for programmers...

As it is said before it's really good to see suggestions made in this column are taken up by programmers and new projects get developed as a result. Following on from the last column, programmer Mark Wherry is now really gathering information on "Windows Only" projects with an eye to programming an ability that will enable Atari users to access many of the functions of some of these projects.

However, the biggest nut to crack is the fact that many of these projects use the Windows operating system and computer memory and hardware to handle everything other than the actual coding. Mark Wherry mentions not to taking up the wrong time.

At Janderone's, Windows projects leave the computer to do all the work that a compiled image on the printer. This was the Atari platform perfectly since GDCOS has always worked the way Janderone's developing a new program to support these printers will need Janderone's and Atari drivers.

Working with printing matters, however, we recently made an Atari command-line OS that can handle many of the functions for Atari's own and Janderone's and it is now agreed that I would be good if such a library existed in Papyrus format.

ON READER DISK

The subsequent description and supply of some vital data by Roger Derry (of Memorex) fairly enabled Gary Bredridge to come up with a program that converts Avery Windows label configurations files into the required Papyrus paper format. AUTOLAB is the name of the program, it is simple to use and appears to do the job very well, you'll find a copy on the Reader Disk.

AUTOLAB was a direct result of interest from and given from Martin Dryden and follow-up postings from myself and others on CDX and is just given to those programmers are more than willing to have a go at a project if they get some help and feedback. So, if you've got an idea for a program that could do something useful

for you and other Atari users, please do let us know.

One good aspect of the present Atari scene is that many programmers are either working together or at least working to similar guidelines and protocols. One other excellent way of co-operating is to allow the main program to use modules programmed by someone else, as is the case with the CAM web browser. One of the latest projects to interface with CAM in such a way is GETHIVE which can translate a German language web page into English on the fly. This prompted Joe Cornier to suggest it might be a good idea if someone programmed a CAM module to turn HTML documents/pages into raw ASCII.

So if anyone is up to this task I'd be more than delighted to see the results! Finally I've had a lot of response to my plan mentioned in the last issue for a directory of people willing to assist.

Other Atari users with help and advice. However, we really need some more offers of help, so if you think you can help please get in touch with me via the usual address or email me at mike@janderone.com.

Mike Katslake

STOS Corner

Anthony Hoskins' (Falcon) Extensions

The restructuring of Anthony Hoskins (Falcon) extensions has now been completed and importantly most of them are now ST compatible. For example the 3D effect menu and 3D effect file editor are now available to all ST users.

As promised, Anthony has sent out the untested extensions (non-printer only) version of the ST compatible extensions and you'll find them on the Reader Disk.

ON READER DISK

- X_EFF.H: TOS Screen System Control 3D menu & Alerts Generator GDCOS extensions
- X_EFF.H: TOS Example programs showing how to use the new commands
- X_GDCOS.TOS: Documentation
- INSTALL.TXT: Installation instructions

Because of the major restructuring some of the commands have had to be redefined or renamed to minimise any backward compatibility problems with the older version.

Read the documentation carefully to ensure you're aware of the potential problems then proceed as follows:

- 1. Save any older programs in ASCII (uncompiled) form along with any data files.

- 2. Install the new extensions and use a text editor to replace any changed commands with their new equivalents.
- 3. Edit within the STOS editor, retain each edited program and its associated data banks (if any).
- 4. Save it away as a normal program.

Sprite Engine

I recently mentioned Anthony was working on a new sprite engine unfortunately due to a hard disk mishap he's lost the source code! Hopefully he'll be able to get it back together.

Recently STOS development seems to have stalled with most of the scene developers working on other projects. For this reason we've decided to close this column - unless we get word of progress from a further Atari based STOS sub-project - with suggestions for future coverage in a couple of you.

Markon Miles

Getting Clever!

papyrus

An object lesson in Papyrus from Michael High...

Michael High introduces the tale of "Text and the Three Objects" to explain the difference between

Word Processing and DTP

Having assessed the use of styles and objects, you have the last 2 tools needed to produce professional looking letters and reports. We can take this one stage further and produce multiple column documents with leaders and headers by the means use of the "Page Layout" and "Master Page" options. These are well covered from pages 121 and 143 of the original manual. I have clear functionality and changes have hardly changed between Papyrus v3 and v4. I have assumed that you have read up on the subject so we can press on.

The manual tends to use the term objects - is a variety of objects which can be confusing. In my definition, all Papyrus documents contain a text. They may utilize one some of the three objects

Word Processing uses

Text. Text objects characters entered by the keyboard whose position on the page is determined by the way all previous text fits up the "Master Page Layout". You can control the horizontal margins and the paragraph offsets from the previous and subsequent paragraphs, but the position within the document will usually change as you modify previous text.

➤ Beautiful text document

Text Document Object	
Paragraph offsets...	
Page break	A%
Column break	A%
Hyphenation...	A%
Function keys...	
Copy ruler	A3
Paste ruler	A4
Group lines	A1
Ungroup lines	A1

There are only two mechanisms which allow you to lock text into a particular vertical position within the document. The first is the use of page and column breaks to place text at the top of a new page or column. The second is the use of the group lines command to make sure text elements are not repositioned across an automatic page / column break whenever printing text is modified. For example, a heading could be grouped with the first few lines of the next paragraph.

DTP also uses "Objects"

"Objects" may be placed anywhere within the printer margin as they can be anchored to a particular piece of text. They can also be anchored to a specific place on a page and so need not move when previous text is modified. They can hence compound text to flow round them. They can also be superimposed on each other in layers. There are three basic types of objects: pictures, drawings and text objects.

Object Options

Fill pattern...	
Line style...	
Colour...	
Orientation...	
Attributes...	
Picture size...	
Wrap...	
Picture window...	A28
Bring to front	
Send to back	
Table...	A1
Cell format...	A4F
Calculation...	A5

➤ Plenty of object options

Pictures

Since the release Papyrus v4 it has been very good at handling pictures with its

standard image and ddt output from "load" programs. These can be enlarged or reduced, stretched and rotated round the four points of the compass. All loaded pictures are held in the Papyrus window from Papyrus v3, these may be held by the reference, in this way if the original picture file is altered, the Papyrus document is automatically updated next time it is opened.

➤ The last place in two pictures

PhotoPaint users, like myself, need not be put off by the reference to "Colour printing" on the Picture page of the Object attributes dialog. It is just as handy for making fine adjustments to images being printed on black and white printers. A tip for NWOL users here is to leave the "Master page" output device option (Papyrus v4) or output device default (Papyrus v3). This leaves the NWOL practitioners to perform their own deburring line process of converting the colours and grey scales into a pattern of dots. By using the NWOL Master page line control can be exercised over not only the intensity but also the colour separation and screen curve. Colour users in particular can add this to the line curve control prior draw file to cover different paper types such as normal glossy and transparency (even black and white laser printers can benefit from this technique, particularly when producing transparencies for overhead projection).

Remember that Papyrus is more low level at handling vector pictures. This is a shame, since they are resolution independent, take up little disk space and print so well. It certainly comes as a disappointment to Randomly users. The

problem is that Papyrus can not handle GEM files with colour fills or angled text. In other words it only handles black lines! However all is not lost if you can follow these steps:

- 1 Open your vector drawing in Rembrandt or whatever you created it
- 2 Save it in the format you require in your Papyrus document
- 3 Print it so it is using the AGD (ie SpeedDraw) image driver at the resolution you intend to print the rest of your document (300 dpi, 600dpi or other dpi setting). This creates a crisp (and colour) PNG format file which can then be imported into Papyrus and will appear at the desired resolution without loss of quality

Drawings

Drawing Objects

Papyrus can draw drawings in the same way as GEM files. As such, they do not appear in the Papyrus window. They are given lines and left to their own devices so to be used in drawings and sub drawings you set. They can be assigned with various attributes including colour, pattern, line style and arrowheads. The position and size attributes can be set precisely by taking notes the [link] key (this may be disabled for previously horizontal or vertical). They can be placed in front of or behind text or other objects. Papyrus uses the z-order of the given base!

Text Objects

This is where the fun begins. Suppose you have created a three column newsletter. Now the copying window needs to get narrower than the columns. Here is a step by step guide:

- 1 Select the Text Objects icon in the toolbar and draw a box in the required width. The height is not important at this stage

- 2 Place the frame in the text object

- 3 Right click to display the attributes dialog box where the dialog box the size defaults (smaller or larger or same) for Word Wrap on. On the 'Position &

- Size' page check. Object height grows with text, and clear the other boxes
- 4 Select the Text Object and enter within the new text object to enter your text
- 5 Use the Object Text to select the entire text object. This way then format the whole text by choosing a text style or a particular font (not individual words or letters can be locally formatted by selecting them with the text tool). In Papyrus all the text objects may also be given a fill and line border with individually set colours. It may even be rotated in any angle, although you should be warned that wrap does not always work correctly except at the last point of the column

- 6 Proofed positioning for the text object

These objects can be set up very quickly yet they have the power to transform a document into a visually interesting presentation people will want to read!

For example, take a look back to the first article in this series on GEM and AGD. The layout designer printed out a long sentence from the article and reproduced it as a text object in the second column. The title and the text object are the first things you read and the combination set the scene for the article in a simple but effective way. The article flows around it and may call to read itself!

I have covered the topics I originally had in mind when I began writing this

and write to it as now relying on you for feedback and suggestions if you want this series to continue - I hope you've found them useful so far. If you'd like this then please send your feedback and/or suggestions

on disk in ASCII or Papyrus format to the address in the next page.

Email: mchad_high@net.com

FONT FRENZY!

The arrival of SpeedDraw and AGD is upgrading to handle colour fonts means that there were have come to literally thousands upon thousands of fonts in both Postscript and TrueType formats.

Some fonts are produced commercially others are donations, regularware and others are simply free. You may well find that most of the remaining PC & Macintosh libraries can supply a extensive range of fonts in the latter two categories. Commercial fonts are available usually via CD-ROM for our readers that interested in the price of computer fonts or by giving direct to the type foundry themselves.

Owners of Papyrus who purchased the upgrade from v1 to v2 have already may have been lucky enough to receive the 1000 Font CD as part of the package and the fonts in that issue for a font collection. The CD contains both Postscript and

TrueType versions of some excellent fonts.

However, having a good collection of fonts is not the end of the story. The installation means that that someone has a new DTP or WP package because the first thing we receive from there is a letter or document using dozens of different fonts!

It is a good advice to restrict the number of fonts you use in a document to just two or three. You can make it appear more by careful use of Bold, Italic, and other font styles.

There is an unspoken wisdom that you should use a serif (perhaps serif font) for body text and a sans serif font for headings and sub-headings. In many cases this is a good rule to work with although you should always take into account what sort of image you want the document to present. Atari Computing uses a Sans font for our headings, and Helvetica 12 for the body text. Although Helvetica is classed as a sans serif font, along with the use for GEM files and Clipart, it doesn't have the warm look of a typical sans font and is not on the eye for large amounts of text.

Display fonts like Helvetica are something very different and should only be used sparingly and never used as body text unless as a special effect.

Phil Kerslake

User Group News

I sometimes wonder why it seems to be so hard to get people interested in actually attending a user group meeting. As can be seen in this month's report from a recent WYAG meeting people are there to help each other, and it is a place where there is always something to learn no matter what your level of experience or to help and make the effort to get out to a meeting and see for yourself!

Drop a line to Harry Siders, chairman of The UK Association of Atari User Groups and he'll put you in touch with a group in your area or give you ideas on how to start one if there is no local group.

As Harry says "Whatever Activities gather the sharing of accumulated knowledge and experiences of those fully aware the power we share for our machines. The freedom to achieve whatever quickly results in the fields of art and restoring music and MIDI communications and web page creation of course read on and appreciate this publication, desktop publishing and document processing, with a little bit of image retouching thrown in for good measure, pay for reasonable entrance to that fact. It is the User group domain that these skills can be shown in their best light by people you know taking their time to show you exactly how they manage it."

Please remember to include an SAE and date (if necessary) when writing to Harry requesting a reply because the UKAUG is a non-profit organisation.

The UK Association of Atari User Groups comprises an index covering all currently existing UK Atari User Groups to enable people to make contact with others to share their knowledge and skills and to discuss any solutions to real life questions. These groups fall into nine categories:

PROMOTIONS 'R' US

It **WILL** **WILL** **WILL** be possible your user group on these pages really find out! Drop them all you have to do is send us some copy. And it's a page in for user groups all around the world! Contact UK user groups. If you've reached with a user group and would like a mention then please to get in touch! Alan Computing (User Groups) "User Groups" Computer Group, Johnstone, PA5 1UB Scotland or Email: atariusergroups@compuserve.com or Fax: 01 330 333 600 ext 10

- Local groups with no other experience and general knowledge across a range of topics
- National groups with specialist knowledge of one subject area, such as Colours User

WYAG (White Room Atari Group) meeting report

Shayne Marshall reports
The meeting started quietly with a few late arrivals, but soon everyone around me couldn't believe how time flew. The biggest surprise to everyone was the announcement from Alan Jackson that he had a new way to play with... and soon he was the envy of us all!

While on holiday up in Scotland (Wyllie John's come to one of our STAG meetings?) Al Alan put up the banner of the decade - a 1600 with 4MB memory, a 127MB hard-drive and SVGA monitor for the princely sum of £1800! He all packed with him and tried to offer him a few pence more for 1 so that he would show a profit, but surprise surprise he refused our offers.

In another corner, someone since in action, Antony had just bought a new scanner and was demonstrating its capabilities and how to use the software.

Teddy I didn't have the time to try the scanner out at the meeting because Adrian Hough spent the most of the meeting trying to figure out what was wrong with his MIDI on my system. After many a crash a tank a full re-installation to get it working and now there's just some low tuning to do.

(Everyone started to have a good time, we just didn't have it for most time because before we realised it was time to go.

Future meetings of the White Room Atari Group will be held at 4 Langside Drive, Bield, New-Infants. Please get in touch for directions and dates.

SVAG (Southend & Warrickshire Atari Group)

A quick note on for a fledgling user group writing in the Standard upon Peter Warrickshire area. The group was started by Carl Turner and Peter Warrickshire who first met each other through the Atari Whistles - a magazine which contained a name and address listing of everyone in the club on this. Both Carl and Peter were asked to alter a couple of details back and forth they started the user group. They're actively looking for new members to try and establish the group where all aspects of Atari computing will be discussed. Carl and Peter can offer experience connecting to the Web, setting up email and handling file attachments and generally troubleshooting any problems people may have. In early meetings will be held at "The Bird in Hand" pub in Warrickshire on Thursdays. Meeting dates are still to be confirmed, and you live in the area and know a friendly chat with like minded people then do get in touch.

Carl Turner 28 Southfields, Bieldon, Warrickshire, CV34 4BS

Images on tap

Xav finally presents that Team Tap circuit diagram...

worth buying them in bulk (Tapes often sell in bundles of 100 for a few pence). The capacitors C1 and C2 are both ceramic disk types which act as local reservoirs of energy for the ICs so should be mounted as close to U1 and U2 as possible.

Before the next issue I intend to construct my own Team Tap so I should be able to report more on close-address as my experiments progress. Naturally errors may have crept into my initial examination of the Team Tap or the subsequent

■ Instead print a copy of Xav's Team Tap. This issue has also been included on the *Reader Disk* in *Q&A* magazine format.

The circuit diagram isn't exactly as daunting as it first appears, although that's exactly what I spent ages trying to do myself! The actual circuit board looks far more complex.

Technical notes

All the diodes are small signal diodes (1N4148 or similar) and need a five pin header. They're the same as the ones used in the joystick and several otherworking TAP projects, so it might be

ON READER DESK

If you're wondering about that apparently out of place diode connected to pin 5 on port D (and hence to pin 11 of U1) on the disk, I'm not certain of its purpose either. Nevertheless, I have checked and double checked an original Team Tap, and it's definitely present on the circuit board.

A similar anomaly is the connection between pins 7 and 14 of each of the four joystick sockets. All logic devices there should connect to the positive supply, but detailed examination of the original Team Tap shows this is not the case.

connection of both of envelope designs to the circuit diagram presented here.

Neither myself nor Atari Computing accept any responsibility for anything based on this design.

Next time we'll begin breaking this design down into manageable sections. In the meantime it's worthwhile re-reading the previous columns which should help you figure out at least some of the technical details and you might also notice some similarity with the joystick system itself. □

Bombaman

v1.0

Jonathon Adams keeps his head down long enough to gather his thoughts...

Bombaman is a multi-player bombs game for the STe which has been under development for two years by Kevin Callahan. Bombaman is programmed entirely in assembler and 48000 assembly code and it takes advantage of the extra STe only features which makes for lots of high speed action on-screen simultaneously.

The plot is a joke. Two little guy men stand trying to kill the other little guy by lighting bombs to destroy bombs until you both yourself facing your enemy who is doing the same thing. The last player left standing wins the round.

Bombs explode North to South and East to West and as bombs are destroyed bombs and powerups appear which can be picked up and used to assist you.

Between four and four players can play one using the normal ST joystick

connection and another two using Provenge or joystick modified to work with the extra ST joystick ports. In addition to the 1M included in the accompanying test file, Bombaman runs from floppy or hard disk and the available Options, a choice control of player positions, play area, select on sound, calibration, instructions, credits and resetting the screen.

The original sound track consists of three channel chip music which can be turned off if desired. It is a non-MIDI music, but once the processor is already working overtime this is probably a good thing. Dropped bombs produce flashy chain pulses rapidly one second before exploding when they may start a chain reaction triggering other bombs.

Game response is silky smooth and the control interface is easy to get to grips with. This version is faster than other ST versions and doesn't suffer from the annoying "spring" caught in wall corners problem which spoils other versions.

The graphics are both colourful and cheerful and are due to be revamped because Kevin is into some of the graphics which look weird on some of the bomb grids. The characters run amusingly, bombs pulse smoothly and the explosions look good.

To keep the action moving there is plenty of power ups including extra bombs, extra range, speedups, slowdowns, reverse polarity, oscillating global effects, ghost bombs, out-of-control and long fuse lighting bombs, throwing bombs, multiple

random effects, plunger, bonus multiplier, bonus termination and more.

When you pick any of these up, your guy is identified as having the bonus by graphics around his head. Some bonuses only last a while whereas others persist for the duration of the battle.

This ability to look and throw bombs or initiate combat as opportunities also sets this version apart from its peers. It is very satisfying too as a well timed bomb to trap your opponent. The control method for throwing and kicking is easy: lay a bomb, look in the direction you want it thrown or kick it then hit the space bar. Thrown bombs bounce off the arena walls so be careful not to trap yourself.

Really if you're taking to long to kill off your opponent/s a winning bomb is the appearance of bombs which harm everyone triggering bombs in their wake and leaving the bomb as a closure condition.

The unregarded version has a lot of number of bombs and fewer game areas to distinguish your copy or as Kevin says, "If so, one register. I'll soon get the message" ©

Notes: Requires a Super CD-ROM drive, plus an IDE for an internal hard disk (optional) or your email address, or return for which you'll receive a full version.

Requires: Amiga STe 10MB minimum

Pros: Fast multi-player fun, makes use of the weird border area.

Cons: No option to play against computer or via the keyboard.

Spin! v0.34

Mario Becroft takes Spin! for a spin...

These days practically every computer over five a CD-ROM drive, and CD-ROM is more convenient to the Atari than ever. Not only are there more Atari-specific CD-ROMs becoming available, but the Atari can also take advantage of many "PC" CDs.

A SCSI CD-ROM drive can be connected to any newer Atari machine via its built-in SCSI by simply plugging it in. Older machines will require a SCSI or SCSI adapter such as the Link 87. But the other important requirement is driver software, without which the drive is useless. And that's where Spin! comes in.

Macintosh, the software previously used to access CD-ROM drives, adds functionality to the operating system to enable alternative storage media other than hard and floppy disk drives to be used with TOPS. It does this through the use of SCSI and CD-ROM drivers. The SCSI drivers provide the lower level access to the actual hardware, while the CD-ROM drivers provide the high level interface between the filesystem on the storage media and the application software. For our filesystems can easily be used the same physical storage hardware such as a hard disk drive and that is why the two different drivers are necessary.

The release of MINT and its introduction of loadable filesystems rendered the Macintosh DOS driver obsolete. Later MINT (and now Mac OS) any filesystem can be supported using a loadable filesystem driver so Macintosh is no longer relevant.

Spin! is supplied as a MINT or Mac OS loadable filesystem, but it still uses Macintosh for the lower level access via a BIOS driver. This means all existing CD-ROM hardware supported by

Macintosh remains accessible to Spin! using the original BIOS drivers but the DOS drivers are no longer necessary - these are what Spin! requires.

Use of the current CD-ROM drivers Spin! has a CD-ROM file assigned to a new drive letter and the CD can then be accessed like another media. Unlike other drivers, Spin! supports multiple CD-ROM filesystems, such as:

- ISO9660 Level 1
- ISO9660 with longer names
- ISO9660 with Rockridge extensions
- ISO9660 with Apple extensions
- ISO9660jules
- Macintosh HFS
- Apple's CD

This means so called long and case sensitive filesystems are processed - which

is particularly handy when accessing CD-ROMs created on Windows 11. Many Spin! users will also benefit from the Macintosh HFS CD-ROM support which allows Macintosh CDs to be accessed on the Atari. Many other CD-ROM drivers fail to read multi-session CD-ROMs in my experience, but Spin! handles them without problems.

Audio CD support has also been improved. If an audio CD is inserted and the user tries to access it like a CD-ROM rather than the entry in a menu message, he will find on the CD a series of programs, one per track. Double-clicking on a program plays the chosen audio track - no other software or player is necessary!

With CD-ROM drives that support the format audio tracks also show up on screen (MINT does, which can be copied to

the hard disk by a simple Drag&Drop operation) so the desktop CD mount CD player programs will also do a work as normal.

Aside from these outstanding features Spin! functions like any other CD-ROM driver. Spin! is available in two versions to suit either MINT or Mac OS, and installation under MINT is as simple as copying SPIN.DSK to the MINT folder. If Macintosh is not already installed, it must also be copied to the AUTO folder and the CDROMS.DTS file has to be edited to reflect the correct configuration. A compact version of Macintosh, called Macintosh, is supplied with Spin! and this contains all the features needed to use Spin! with the other files removed. Although this works a treat on the MINT version of Spin! the Mac OS version functions to match the same way. ☺

SPIN!

Author

Gavin R. Beckett
Email: gfr@compuserve.com
File: /usr/local/src/Spin!-0.34/ (to be installed in /usr/local/src/Spin!)

Requires

CD-ROM, any Atari MINT or Mac OS

Pros

Supports wide range of CD filesystems including ones with long filenames easy to access audio CDs free

Cons

Not as easy to install as compact and alternative

▲ Here's a little preview of the contents of an Audio CD. Spin! doesn't click on a "program" to play the chosen audio track - so other software is required.

Scribble Synth Software based additive synthesizer

- 100 to 1000 Hz user define oscillators, each with independent amplitude decay
- User can easily user define frequency bands per note and
- User can use user define note spans for complex intervals and
- Realtime sampling rates for output generation (5000 to 50000)
- Sample output in 16K, 48K and 96K, grow thing format in 8 or 16 bit
- MIDI sample using the MIDI computer and MIDI/MIDI/MIDI sample
- Auto synthesis and Custom Frequency Mapping mode

E16

Sound Chip Synth FM sound chip synthesizer

- Supports wave oscillator (10K to 100K) with user define filter
- Sound generator (100K to 100K) supports in any oscillator
- Oscillator volume, frequency, phase offset and volume control
- Sample rate and low frequency oscillator with 100K and 100K sample
- Frequency oscillator generator (100K to 100K) sample
- Sample output in 16K, 48K and 96K, grow thing format in 8 or 16 bit
- Auto synthesis and Custom Frequency Mapping mode

E16

Snippet Synth Software based granular synthesizer

- 100K to 100K oscillator frequency bandwidth in 100K settings
- Five different granular (100K to 100K) sample and control
- Five different amplitude modulation (100K to 100K) sample
- Variable sampling rate for output generation (100K to 100K)
- Sample output in 16K, 48K and 96K, grow thing format in 8 or 16 bit
- MIDI sample using the MIDI computer and MIDI/MIDI/MIDI sample
- Auto synthesis and Custom Frequency Mapping mode

E16

MIDI Arpeggiator Analogue-style arpeggiator

- One step for each note, fixed time for arpeggiator settings
- Sample rate and MIDI output (100K to 100K) sample and control
- Program change volume, gain and MIDI channel and 100K sample
- Auto gain, sample rate and left and right channel for 100K sample
- User of play mode, frequency, bandwidth, gain, phase, volume and
- Auto frequency and left and right channel
- Sample rate and MIDI output (100K to 100K) sample and control

E15

EC-909 Analogue drum machine for the STE/TT and Palm

- 5 drum output (100K to 100K) sample and control
- Auto gain, sample rate and MIDI output (100K to 100K) sample and control
- Drums and pattern in 100K to 100K sample and control
- Sample rate and MIDI output (100K to 100K) sample and control
- Sample rate and MIDI output (100K to 100K) sample and control
- Sample rate and MIDI output (100K to 100K) sample and control

E25

All Electronic Cow software is packaged as CD (just one) with an eight page booklet and 17 slide help. Prices include P&H in £1 (UK)

Upgrades are free to registered users. If you'd like to upgrade your software version please send your master disk with an LTR to Electronic Cow. All software that requires 16M memory and a 660MHz floppy for more information on these, and for downloading releases, please visit our web page or contact

1993 I reached my page limit and bought one of the first copies of *Mark & A to Z* and it is still in regular use today. *A to Z* was written with all Agri users in mind with a wide distribution base.

At this slightly-up-to-date time, I have written the 2,139 words (184 words, or 8,688,000 words) still represents the most comprehensive English language reference work available for this Asian platform. In case you are wondering, Mark did consider adding A to Z in ST Glue before last format but that would have involved many more hours of work. Following a discussion on CD Mark offered us a choice between an unversioned ASCII release or just the possibility of hypertext version someone as the factors are one option for the ASCII release now! When asked if users of the printed book are allowed to use the ASCII version without paying the Shikharan fee, Mark replied:

I've thought about this decision and in the end Kim and I are so much closer personally than I am only asking for a favor and in the health-care field experiments to start such a structured survey. After all you wouldn't expect a free video after leaving most of the books at the library.

At just five pounds Akin Expressions excellent value for money and serious cancer support.

Not every state will have noticed the coming of English language learners, but the state of Texas has. In 1997, the state legislature passed a law that required the state to provide English language learners with the same educational opportunities as native English speakers. The law also required the state to provide English language learners with the same educational opportunities as native English speakers. The law also required the state to provide English language learners with the same educational opportunities as native English speakers.

Over the years there have been a few nice top Alan books. Your second financial seminar by Andreas Ramez published by the F&ET Club was the first, followed by *The Coleman Guide to Business Publications* (published by F&ET Club).

single portable library. The output quality is fairly good, which perfectly complements the example tone: a cheerful piano melody, overall almost invisible in the out of place in an early black and white cartoon. This pure economical is certainly not a waste. HDOLAR in this area has in some respect no rival and is a flexible complete package for all DNA sound machines. A small review.

1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678, 2679, 26

The second offering is from Electronic Components Ltd. Loading much like the other, this one has all the same functionality in the sample window as the other three, yours more likely to use. This one has the PLOT sample dump that the sample gallery didn't have. There is a sample play button and that is it for the graphics! Basic or more *ASCII files are supported here with a lot for Volume 1 support. Essential low source code problems (in fact PLOT has nothing

Abstract The purpose of this study was to investigate the effect of a 12-week training program on the cardiovascular and metabolic responses to a 1000-m sprint in young, healthy, sedentary women. The subjects were randomly assigned to a 12-week training group (n = 10) and a control group (n = 10). The training group performed a 12-week program of interval training, while the control group remained sedentary. The subjects performed a 1000-m sprint test at baseline and after 12 weeks. The results showed that the training group had a significantly lower heart rate (HR) and a significantly higher oxygen consumption (VO₂) during the sprint test compared to the control group. The training group also had a significantly lower time to exhaustion (T_{ex}) and a significantly higher peak power (P_{peak}) compared to the control group. The results suggest that a 12-week training program can improve the cardiovascular and metabolic responses to a 1000-m sprint in young, healthy, sedentary women.

Never one looked at FBI Paper #43 as
BUT the release was played PDCI on
his (bars right) using the EMTT or
before 1984, and as a consequence

The Alternative Party

Richard Spewart reports from the annual Atari event.

Held from the 12th to the 13th of April, 1998 (Easter weekend) in the city of Turku, on the west coast of Finland, the Alternative Party was probably one of the best coding parties for the Atari scene so far.

Why the name Alternative Party? For some time now most coding parties have been dominated by people owning high end PCs or Amiga, which lets many use platforms like C++ without a look. In truth this is unfair, the organisers decided in late 1996 that the competitors at least, any PC above a 386 and any Amiga above the standard 4000 machine that, as Richard will know, was the main computer for the ST back in the late eighties and early 90s.

As the first round I sat at a table for Maggie, pages included. The range of the appropriate equipment, some in Finland, known as the Alternative Party.

Party time programming was by the (disputed) Reservoir Gods (creative) a new game which was written during the party itself. Get yourself a copy and send yourself to some good old (disputed) retro gaming school!

Nearest services or what passes for one are on these pages, not to mention more.

Richard Spewart and Chris Holland. The Maggie Team, <http://www.maggie.com> (edit: all support/ideas here)

With the high end machines banned from entering the competition this cleared the way for people with an interest in older machines to make some headway.

Apart from people from the Atari scene, who were the best represented platform, other people brought a variety of machines, some I haven't seen in the UK for many years. A couple of these vintage machines were connected up to relatively new peripherals such as CD drives hooked up to FMX machines. It's a good sign to show there is more to life than PC and Mac hardware!

The party was hosted by members from the Aggression demo group who produced one of the classic ST demos called Brain Damage. There was a large Swedish contingent at the party consisting mainly of members of Daniel Hudson Society (one of the best Amiga demo groups). They are all supporting the Falcon to some degree and made some good entries in the demo competition. David from New Wave Development was also there and he showed us the latest developments in Amiga's Advanture. It was great to see the game looks almost ready with just a few minor improvements remaining to be completed before release.

The English contingent consisted of myself, Chris Holland (CdR), Leon O'Reilly (the Pen/Reservoir Gods), Ken Dempsie (the Reservoir Gods) and Neil Jones (Reservoir Angels).

We also met up with Martin Elve-Roscoe, better known as Q Park, an IRC Atari who had flown over from Canada for the party. Chris and I met him at the flight from England. Q Park unfortunately had a slight problem with his luggage on arrival at Helsinki. Thanks to him, as Heston was not being on the ball, his luggage had to be delivered later on so he stayed.

People outside the demo scene may not recognise the name of Heston. Or know but may well recognise him from his IRC name as that of the Daniel Hudson Society. Chris and I were both looking forward to meeting him for the first time.

but not for his skills. I met Chris Maggie over the last year or so.

Another coder from the same group known as Jake on IRC was also there and he was very pleased to see us. There might well be an appearance from some of the Swedish contingent at the next Atari show whenever that is planned in the UK. One thing was soon realised was Swedish coders are generally a lot better than ourselves!

One guy was there with a Pseudo machine, which I personally didn't get to see much of. It was what I heard the owner did have some impressive stuff to show off.

As is usual with coding parties of this nature, there were other competitions. The first of these was for ASCII art, which ranged from the impressive to the downright bizarre. After a long wait there were also some music compositions. Later on during the party the main part of the competition were shown, which included several new demos and demos for the Falcon. The Daniel Hudson Society had some entries but it was a shame none of the new could make it, but as they said, maybe next time.

There was also a prize given for the most creative machine at the party and it was won by a machine built in the last

(1981) early 1990s. This was used to test circuit boards and to test output and video pins comfortably. It's a huge Atari machine! Never was this needed!

Some stations brought in a big pile of classic hardware, which was placed on a table and used in the demo competition. Hardware such as the Aggravate, J2881 Spectrovision, Atari 2600+ models and one or two other unknowns much was used with a lot of interest by people in the party. The only thing that was reasonably up-to-date on its particular side was a PlayStation®.

One year relative, heavily into the Atari scene had collected his machines in a number of ways. He had fitted an external hard disk and connected an external SCSI Zip drive!

It just goes to show that, with a little ingenuity, it is possible to connect up the latest hardware to obsolete machines. It didn't make the machine a computer, who told me that he had made up the lead to connect the Zip's back and made a last-eye

watch still using the party, which was more in line.

Although the Atari scene was the largest, amongst the ground level of interaction between the scenes (people) no matter what machines people own, impressive programming can still be produced.

Amazingly the number of the demo competition was an average of an unexpected 1000. This was very impressive, even on the big screen and all the more impressive considering just how old the Atari's 28 is compared to the other platforms!

In general, the party was very well organised by the members from Aggravate and VIC Affairs. Thanks to the following: Llewellyn, Partridge, Williams and

Larson. It was also great to meet the Swedish people as well and a big 'Hi' goes out from the Reservoir Gods to the Maggie Team to Anders, Anders (Bj), Buggin' Laker, and everyone else who attended, including the person who travelled probably the furthest distance to get to the party. Q. Thanks!

Author: Reservoir Gods

My Name is better at it - bugger!

www.bugger!

In keeping with our Alternative Party debut theme for this issue, we bring you a review of a game that was actually written in one of the party itself!

Bugger! is actually a thoroughly updated version of the classic Frogger game. It is the guest appearance of the Atari VCS inside version of the crazy but still addictive game on the big screen as the party led directly to the Reservoir Gods deciding to do their own version.

Everything was essential in the road not to produce this game, cheap, fast (just from the old Frogger!) and even

the whimsy promise of a score was abandoned by the dedicated team who barely looked up from their computers while the deed was done. With Bugger! the

last game of Frogger is an offer that is to get the frog across the road (and to avoid being squashed by the oncoming trucks, all one takes off). As with many other

Reservoir Gods games, there is more to it than just a single game, as a whole range of configurable options turn it into

There can be up to six players, any combination of human or computer control, the game can be won with the number of frogs safely across the road out of as many or with the guideline of a timer to measure. Gameplay is simple, but very 'intense' for just the final turn.

The sound and graphics have been suitably updated, with the 'NoColor' treatment, tested out to the intermediate basic frog and car game, but the Atari really shows its deliciousness with the

comedy, simple and GIF personal soundtrack. As with all Reservoir Gods products, the very high standard of polish is apparent, even more incredible considering the fact that the main part of the game was produced over two very hectic and hectic-filled days at the party. We're not quite sure how Bugger! got its name from the Reservoir Gods, it can however confirm that the choice of name was needed to do with certain words that were thrown around by them when something had to be done at the party. The first name around!

Richard Spooner

Q&A

"We always have more answers than questions"

SUMOS

Q I have a MegaTTE and a SUMOS laser printer with a LPT004 laser controller which I use to run Calamus 1.00s. If the laser printer is switched off but connected to the Atari my machine acts very strangely when the Atari hard disk drawer is booted off my 400Fs formatted hard disk. It seems to think it has additional drives attached and normally ends up booting out or presenting a desktop with no drives icons. When I am using my laser I have to pull the DMA cable out of the back of the MegaTTE which is a pain and is slowing the connections very good. Both the MegaTTE and laser work perfectly otherwise. Do ASCII devices have to be terminated like ordinary SCSI devices? I don't want to keep my laser switched on all the time. Is the problem related to the SUMOS laser? There seems to be very few of them about. I have only seen one other guy that got one and he has exactly the same problem as me.

I would also like to see a general article about various hard disk models. I am going to get a 1GB one to replace my 400Fs. Quantum drive (I bought a used 800 MB drive) could not get to work despite three other members of the Hibernia Atari User Group having a play around with the original Atari HD software and TCD software (thanks anyone good). I have also been told the Quantum FinalBt SCSI drives don't fit Atari, although I have heard of one guy with an STs with a SCSI drive. It would be nice to know if Atari can use some of latest drives being released this year which are supposed to run up to 400s with IDE and SCSI on SCSI found great. If you want to run a RSI from some suitable CDS, will do some drive to disk recording all in one? John Hayward, Rotherham

A If the LPT Laser printer and controller are connected to the ASCII connector they must be powered up otherwise you will experience the symptoms you report. There used to be a hardware switch which got around the problem but I haven't seen one for a few years. The simplest solution which minimises wasted power consumption and

keeps the laser printer quiet with out the rear flap just enough to stop the sensor (if necessary use something to wedge a space in that position. To use the printer simply close the flap and the printer starts itself ready for use. crude but effective!

Almost any SCSI controller mechanism can be persuaded to work with Atari hardware given the right combination of terminations and software, which usually means using HD Driver software. Refer to the SCSI Hardware Q&A area in ASCII for more details. IDE mechanisms can also be successfully fitted out of the TUE SCSI interface boards.

Joe Coomber

WWW & CAB 2.5

Q I'm running this combination on my TT fitted with a Megapack Cbus Card and NWCII. I have recently experienced occasional problems trying to access little or disk formatted pages resulting in system locks with the error message: Runtime error and what looks like a list of programs code. Also when on Selected Windows error messages. Too many times and on another occasion error message: Too many frames. Is there any way of saving HTML pages as ASCII text pages, or do I print them out then run the program through a scanner and OCR them?

Nick Kelly via Email

A The number following the Runtime error message relates to a Pure Pascal error code. For example this most common error is: Runtime error P101 which means: 'Insufficient stack space and me. The problem could be with CAB, CAN CWS, or STING and may be not much help to the end user. It's probably worth trying a different CAB CWS file because there are so many different releases.

You certainly don't have to print out HTML documents then OCR them to get to the ASCII in the Options/General CAB setting you can set up a mouse button combination to call up a program menu which includes the option to save the source code of the HTML file. You can now load this file into Everest or other text editor and do a Search/Replace with leaving the Replace field blank which

will strip all the HTML tags leaving printable ASCII. There are also our third phase utilities to convert HTML documents to ASCII which work with varying degrees of success including:

- Etype (the latest version includes an HTML to ASCII converter)
- HTML Help (programmed by Martin Jupp) which offers lots of options
- HTML2ASC (a no frills TOS based utility)

A CAB module to convert HTML source to pure ASCII would be useful.

Jon Coomber/Alexander Coomber
Oliver Broadway/Chris Good

SCSI dump

Q In the Digital out a article in ASCII mentioning Luis suggests using ExtendedDOS Pro on a Falcon to SCSI dump data from a CDD. ROM or bypass the digital out which means crossing the analogue/digital boundary but would like confirmation this is also possible on ST/TTs and not?

Paul Kewey via the message service

A Yes you can use SCSI dump on ST/TTs machines as a simple data transfer operation which is made easy actual in a computer system. ExtendedDOS has included this feature for a number of years now. The Pro version should meet your requirements, otherwise check out the press release of the latest update. ExtendedDOS Gold.

If you're using the ST as a sound source (running a sample sequencer perhaps) then you're restricted to 8 bit resolution. The benefits of dumping from CDD would be offset by having to decrease the resolution as well as convert the sampling rate (if you're concerned about maintaining the speed), although a 4 bit output sampling will be as good as you might want to

ASCII'S BUG REPORT

Digital audio errors

The SNL Errors for the STs and Falcon given last issue were only based on theoretical explanations which (as explained in the article) don't correspond exactly to real life. Let me have shown Henry Daniel Felsen (CDS&G's one of widely varying quality sampling to output 1/16 of about 1000s. Please accept my personal apologies for these errors.

Shooting Lal

Secauc

Once again in ASCII it is mentioned CAB doesn't support certain transactions yet I've been using the feature for a while now so that must be wrong!

ALIEN THING. Awarded 84% in ST Format
79 Now only £9.99 inc. p+p. (Add £1 if outside
the UK) Complete with expert levels and
Joypad support. (If required.)

Supplies to export market - (1 of each only.)

Super 48Mb hard disk drive with cables £45
(AHDI, for STFMII Has been very reliable.
Many utilities.)

HiSoft C Interpreter with Manual £5

USB Sportster Vx 14.4Kb FaxModem £25
with Modem and phone Cables

Apex Index (for Falcon) £15

All prices include P&P

The Atari Portfolio the really Portable personal Computer....

Yes, the amazingly compact 68000-based Portfolio is small enough to
fit in your hand! - yet is powerful enough to offer you facilities you'd
expect to find only on a full-sized desktop or notebook. It will work
for up to 16 hours on three AA batteries (allowance from optional
recharge adaptor) than a thin for portability? The Portfolio works in
11 languages: English, French & German. Comes complete with 8
built-in 6800 applications installed on ROM.

They are:

1 slot 1.25 megabyte expansion slot(s) 68000 editor 1 calculator
Address book Phone dialler Appointment diary
With additional hardware, cable & software the Portfolio can easily
be connected to your VHS, or Apple Mac for file & data transfer.
Moreover not only Portfolio notebooks, but also a wide range of
accessories & peripherals for want to get even more from the really
Portable PC.

For more details visit our website or call
phone in the evening
